Electronic Components Sourcing Information

---

## Product Reference Information

**Part Number:** CYPD2134A-24LQXQT  
**Manufacturer:** Infineon Technologies  
**Package:** 24-UFQFN Exposed Pad  
**Availability:** Please confirm with sales

# EZ-PD™ CCG2 USB Type-C port controller

## General description

EZ-PD™ CCG2 is a USB Type-C controller that complies with the latest USB Type-C and Power Delivery (PD) standards. EZ-PD™ CCG2 provides a complete USB Type-C and USB PD port control solution for passive cables, active cables, and powered accessories. It can also be used in many upstream and downstream facing port applications. EZ-PD™ CCG2 uses Infineon's proprietary M0 technology with a 32-bit, 48-MHz Arm® Cortex®-M0 processor with 32-KB flash and integrates a complete Type-C transceiver including the Type-C termination resistors  $R_P$ ,  $R_D$ , and  $R_A$ .

## Applications

- USB Type-C EMCA cables
- USB Type-C powered accessories
- USB Type-C upstream facing ports
- USB Type-C downstream facing ports

## Features

- 32-bit MCU subsystem
  - 48-MHz Arm® Cortex®-M0 CPU
  - 32-KB flash
  - 4-KB SRAM
  - In-system reprogrammable
- Integrated digital blocks
  - Integrated timers and counters to meet response times required by the USB-PD protocol
  - Run-time reconfigurable serial communication block (SCB) with reconfigurable I<sup>2</sup>C, SPI, or UART functionality
- Clocks and oscillators
  - Integrated oscillator eliminating the need for external clock
- Type-C support
  - Integrated transceiver (baseband PHY)
  - Integrated UFP ( $R_D$ ), EMCA ( $R_A$ ) termination resistors, and current sources for DFP ( $R_P$ )
  - Supports one USB Type-C port
- Low-power operation
  - 2.7 V to 5.5 V operation
  - Two independent VCONN rails with integrated isolation between the two
  - Independent supply voltage pin for GPIO that allows 1.71-V to 5.5-V signaling on the I/Os
  - Reset: 1.0  $\mu$ A, Deep Sleep: 2.5  $\mu$ A, Sleep: 2.0 mA
- System-level ESD on CC and VCONN pins
  - $\pm 8$ -kV contact discharge and  $\pm 15$ -kV air gap discharge based on IEC61000-4-2 level 4C
- Packages
  - 1.63 mm  $\times$  2.03 mm  $\times$  20-ball wafer-level CSP (WLCSP) with 0.4-mm ball pitch
  - 4.0 mm  $\times$  4.0 mm, 0.55 mm 24L QFN
  - Supports industrial (-40°C to +85°C) and extended industrial (-40°C to +105°C) temperature ranges

## 1 Available firmware and software tools

### 1.1 EZ-PD™ Configuration Utility

The EZ-PD™ Configuration Utility is a GUI-based Microsoft® Windows application developed by Infineon to guide a CCGx user through the process of configuring and programming the chip. The utility allows users to:

- Select and configure the parameters they want to modify
- Program the resulting configuration onto the target CCGx device

The utility works with the Infineon supplied CCG1, CCG2, CCG3, and CCG4 kits, which host the CCGx controllers along with a USB interface. This version of the EZ-PD™ Configuration Utility supports configuration and firmware update operations on CCGx controllers implementing EMCA and display dongle applications. Support for other applications, such as power adapters and notebook port controllers, will be provided in later versions of the utility.

For the application and its associated documentation, see the [USB EZ-PD™ Configuration Utility](#) web page.

## 2 EZ-PD™ CCG2 block diagram

Figure 1 EZ-PD™ CCG2 block diagram

## **3 Functional overview**

### **3.1 CPU and memory subsystem**

#### **3.1.1 CPU**

The Cortex®-M0 CPU in EZ-PD™ CCG2 is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. It mostly uses 16-bit instructions and executes a subset of the Thumb-2 instruction set. This enables fully compatible binary upward migration of the code to higher performance processors such as the Cortex®-M3 and M4, thus enabling upward compatibility. The Infineon implementation includes a hardware multiplier that provides a 32-bit result in one cycle. It includes a nested vectored interrupt controller (NVIC) block with 32 interrupt inputs and also includes a wakeup interrupt controller (WIC). The WIC can wake the processor up from the Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in the Deep Sleep mode. The Cortex®-M0 CPU provides a non-maskable interrupt (NMI) input, which is made available to the user when it is not in use for system functions requested by the user.

The CPU also includes a serial wire debug (SWD) interface, which is a 2-wire form of JTAG. The debug configuration used for EZ-PD™ CCG2 has four break-point (address) comparators and two watchpoint (data) comparators.

#### **3.1.2 Flash**

The EZ-PD™ CCG2 device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The flash block is designed to deliver 1 wait-state (WS) access time at 48 MHz and with 0-WS access time at 24 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average. Part of the flash module can be used to emulate EEPROM operation if required.

#### **3.1.3 SRAM**

A supervisory ROM that contains boot and configuration routines is provided.

### **3.2 USB-PD subsystem (SS)**

EZ-PD™ CCG2 has a USB-PD subsystem consisting of a USB Type-C baseband transceiver and physical-layer logic. This transceiver performs the BMC and the 4b/5b encoding and decoding functions as well as the 1.2-V front end. This subsystem integrates the required termination resistors to identify the role of the EZ-PD™ CCG2 solution.  $R_A$  is used to identify EZ-PD™ CCG2 as an accessory or an electronically marked cable.  $R_D$  is used to identify EZ-PD™ CCG2 as a UFP in a hybrid cable or a dongle. When configured as a DFP, integrated current sources perform the role of  $R_p$  or pull-up resistors. These current sources can be programmed to indicate the complete range of current capacity on VBUS defined in the Type-C spec. EZ-PD™ CCG2 responds to all USB-PD communication. The EZ-PD™ CCG2 USB-PD subsystem can be configured to respond to SOP, SOP', or SOP'' messaging.

The USB-PD subsystem contains a 8-bit successive approximation register (SAR) ADC for analog to digital conversions. The ADC includes an 8-bit DAC and a comparator. The DAC output forms the positive input of the comparator. The negative input of the comparator is from a 4-input multiplexer. The four inputs of the multiplexer are a pair of global analog multiplex buses an internal bandgap voltage and an internal voltage proportional to the absolute temperature. All GPIO inputs can be connected to the global analog multiplex buses through a switch at each GPIO that can enable that GPIO to be connected to the MUX bus for ADC use. The CC1, CC2, and RD1 pins are not available to connect to the MUX buses.

## Functional overview

Figure 2 USB-PD subsystem

### 3.3 System resources

#### 3.3.1 Power system

The power system is described in detail in the section [Power on page 13](#). It provides the assurance that voltage levels are as required for each respective mode and either delay mode entry (on power-on reset (POR), for example) until voltage levels are as required for proper function or generate resets (brown-out detect (BOD)) or interrupts (low voltage detect (LVD)). EZ-PD™ CCG2 can operate from three different power sources over the range of 2.7 V to 5.5 V and has three different power modes, transitions between which are managed by the power system. EZ-PD™ CCG2 provides Sleep and Deep Sleep low-power modes.

#### 3.3.2 Clock system

The clock system for EZ-PD™ CCG2 consists of the internal main oscillator (IMO) and the internal low-power oscillator (ILO).

### 3.4 Peripherals

#### 3.4.1 Serial communication blocks (SCB)

EZ-PD™ CCG2 has two SCBs, which can be configured to implement an I<sup>2</sup>C, SPI, or UART interface. The hardware I<sup>2</sup>C blocks implement full multi-master and slave interfaces capable of multimaster arbitration. In the SPI mode, the SCB blocks can be configured to act as master or slave.

In the I<sup>2</sup>C mode, the SCB blocks are capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and have flexible buffering options to reduce interrupt overhead and latency for the CPU. These blocks also support I<sup>2</sup>C that creates a mailbox address range in the memory of EZ-PD™ CCG2 and effectively reduce I<sup>2</sup>C communication to reading from and writing to an array in memory. In addition, the blocks support 8-deep FIFOs for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduce the need for clock stretching caused by the CPU not having read data on time.

The I<sup>2</sup>C peripherals are compatible with the I<sup>2</sup>C Standard-mode, Fast-mode, and Fast-mode Plus devices as defined in the NXP I<sup>2</sup>C-bus specification and user manual ([UM10204](#)). The I<sup>2</sup>C bus I/Os are implemented with GPIO in open-drain modes.

The I<sup>2</sup>C port on SCB 1 block of EZ-PD™ CCG2 is not completely compliant with the I<sup>2</sup>C spec in the following:

- The GPIO cells for SCB 1's I<sup>2</sup>C port are not overvoltage-tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I<sup>2</sup>C system.
- Fast-mode Plus has an I<sub>OL</sub> specification of 20 mA at a V<sub>OL</sub> of 0.4 V. The GPIO cells can sink a maximum of 8-mA I<sub>OL</sub> with a V<sub>OL</sub> maximum of 0.6 V.
- Fast-mode and Fast-mode Plus specify minimum fall times, which are not met with the GPIO cell; Slow strong mode can help meet this spec depending on the bus load.

#### 3.4.2 Timer/counter/PWM block (TCPWM)

EZ-PD™ CCG2 has six TCPWM blocks. Each implements a 16-bit timer, counter, pulse-width modulator (PWM), and quadrature decoder functionality. The block can be used to measure the period and pulse width of an input signal (timer), find the number of times a particular event occurs (counter), generate PWM signals, or decode quadrature signals.

### 3.5 GPIO

EZ-PD™ CCG2 has up to ten GPIOs in addition to the I<sup>2</sup>C and SWD pins, which can also be used as GPIOs. The I<sup>2</sup>C pins from SCB 0 are overvoltage-tolerant. The number of available GPIOs vary with the package. The GPIO block implements the following:

- Seven drive strength modes:
  - Input only
  - Weak pull-up with strong pull-down
  - Strong pull-up with weak pull-down
  - Open drain with strong pull-down
  - Open drain with strong pull-up
  - Strong pull-up with strong pull-down
  - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTTL)
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Hold mode for latching previous state (used for retaining I/O state in Deep Sleep mode)
- Selectable slew rates for dV/dt related noise control to improve EMI

During power-on and reset, the I/O pins are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Pinouts

Figure 3 20-ball WLCSP EZ-PD™ CCG2 ball map (bottom view)

Figure 4 24L QFN pin map (top view)

## 5 Power

The following power system diagram shows the set of power supply pins as implemented in EZ-PD™ CCG2.

EZ-PD™ CCG2 can operate from three different power sources. VCONN1 and VCONN2 pins can be used as connections to the VCONN pins on a Type-C plug of a cable or VCONN-powered accessory. Each of these inputs support operation over 4.0 V to 5.5 V. An internal isolation between VCONN1 and VCONN2 pins is provided allowing them to be at different levels simultaneously. CCG2 can be used in EMCA applications with only one or both VCONN pins as power sources. This is illustrated later in the section on applications. Besides being power inputs, each VCONN pin is also internally connected to a  $R_A$  termination resistor required for EMCA and VCONN-powered accessories.

EZ-PD™ CCG2 can also be operate from 2.7 V to 5.5 V when operated from the VDDD supply pin. VCONN-powered accessory applications require that CCG2 work down to 2.7 V. In such applications, both the VDDD and VCONN pins should be connected to the VCONN pin of the Type-C plug in the accessory.

In UFP, DFP, and DRP applications, CCG2 can be operated from VDDD as the only supply input. In such applications, the VCONN pins are left open. In DFP applications, the lowest VDDD level that CCG2 can operate is 3.0 V due to the need to support disconnect detection thresholds of up to 2.7 V.

A separate I/O supply pin, VDDIO, allows the GPIOs to operate at levels from 1.71 V to 5.5 V. The VDDIO pin can be equal to or less than the voltages connected to the VCONN1, VCONN2, and VDDD pins.

The VCCD output of EZ-PD™ CCG2 must be bypassed to ground via an external capacitor (in the range of 1 to 1.6  $\mu\text{F}$ ; X5R ceramic or better).

Bypass capacitors must be used from VDDD and VCONN pins to ground; typical practice for systems in this frequency range is to use a 0.1- $\mu\text{F}$  capacitor. Note that these are simply rules of thumb and that for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

**Figure 5** shows an example of the power supply bypass capacitors.

**Figure 5** EZ-PD™ CCG2 power and bypass scheme example

## 6 CCG2 programming and bootloading

There are two ways to program application firmware into a CCG2 device:

1. Programming the device flash over SWD Interface
2. Application firmware update over specific interfaces (CC, I<sup>2</sup>C)

Generally, the CCG2 devices are programmed over SWD interface only during development or during the manufacturing process of the end product. Once the end product is manufactured, the CCG2 device's application firmware can be updated via the appropriate bootloader interface. However, it is recommended to disable the update over bootloader interface before the end product goes to mass production, unless a secure method of firmware update is implemented by the customer.

### 6.1 Programming the CCG2 device flash over SWD interface

The CCG2 family of devices can be programmed using the SWD interface. Infineon provides programming kits (**CY8CKIT-002 MiniProg3 Kit**) called MiniProg3 and (**CY8CKIT-005 MiniProg4 Kit**) MiniProg4 which can be used to program the flash as well as debug firmware. The flash is programmed by downloading the information from a hex file. This hex file is a binary file generated as an output of building the firmware project in **PSoc Creator Software**. Click [here](#) for more information on how to use the MiniProg3 programmer. Click [here](#) for more information on how to use the MiniProg4 programmer. There are many third-party programmers that support mass programming in a manufacturing environment.

As shown in the block diagram in **Figure 6**, the SWD\_IO and SWD\_CLK pins are connected to the host programmer's SWDIO (data) and SWDCLK (clock) pins respectively. During SWD programming, the device can be powered by the host programmer by connecting its VTARG (power supply to the target device) to VDDD pin of CCG2 device. If the CCG2 device is powered using an on-board power supply, it can be programmed using the "Reset Programming" option. For more details, contact [Infineon support](#) for CCGx programming specifications.

**Figure 6** Connecting the programmer to CCG2 device

### 6.2 Application firmware update (I<sup>2</sup>C, CC)

The application firmware can be updated over two different interfaces depending on the default firmware programmed into the CCG2 device. Refer to **Table 29** for more details on default firmware that various part numbers of the CCG2 family of devices are preprogrammed with (note that some of the devices have bootloader only and some have bootloader plus application firmware).

### 6.2.1 Application firmware update over I<sup>2</sup>C interface

This method primarily applies to CYPD2104 and CYPD2122 devices of the CCG2 family. In these applications, the CCG2 device interfaces to an on-board application processor or an embedded controller or a billboard device that will act as a USB to I<sup>2</sup>C bridge over I<sup>2</sup>C interface. Refer to [Figure 7](#) for more details.

**Figure 7** Application firmware update over I<sup>2</sup>C interface

### 6.2.2 Application firmware update over CC interface for DFP applications

This method primarily applies to the CYPD2134 device of the CCG2 family. For bootloading, the CY4532 CCG3PA EVK can be used to send programming and configuration data as Infineon-specific Vendor Defined Messages (VDMs) over the CC line. The CY4532 EVK's base board is connected to the system containing CCG2 device on one end and a Windows PC running the [EZ-PD™ Configuration Utility](#) as shown in [Figure 8](#) on the other end to bootload the CCG2 device.

**Figure 8** Application firmware update over CC interface for DFP applications

### 6.2.3 Application firmware update over CC interface for cable applications

This method primarily applies to the CYPD2105 devices of the CCG2 family. Refer to the [EZ-PD™ Configuration Utility user manual](#) for further details on how to do the application firmware update over CC interface for cable applications.

## 7 Application diagrams

### 7.1 EMCA Applications

**Figure 9** to **Figure 12** show the application diagrams of a Passive EMCA application using CCG2 devices. **Figure 9** and **Figure 10** show the application using a single CCG2 device per cable present at one of the two plugs, whereas **Figure 11** and **Figure 12** show the same with two CCG2 devices per cable present at each plug. The VBUS signal, the SuperSpeed lines, HighSpeed lines, and CC lines are connected directly from one end to another.

The application diagrams shown in **Figure 9** and **Figure 10** require a single VCONN wire to run through the cable so that the CCG2 device can be powered irrespective of which plug is connected to the host (DFP). However, in the application diagrams shown in **Figure 11** and **Figure 12**, the VCONN signal does not run through the entire cable, but only runs to the respective VCONN pin of the CCG2 device at each end of the plug. Also, only one CCG2 device is powered at any given instance, depending on which one is nearer to the DFP that supplies VCONN.

**Note:** Application diagram in **Figure 10** requires external diodes to operate in the extended VCONN voltage range of 2.7 V to 5.5 V.

**Figure 9** Passive EMCA application – Single EZ-PD™ CCG2 per cable (VCONN range between 4.0 V to 5.5 V)

**Figure 10** Passive EMCA application – Single EZ-PD™ CCG2 per cable (VCONN range between 2.7 V to 5.5 V)

## Application diagrams

**Figure 11**      **Passive EMCA application (PD3.0/USB4) – Single EZ-PD™ CCG2 per plug (VCONN range between 4.0 V to 5.5 V)**

**Figure 12**      **Passive EMCA application – Single EZ-PD™ CCG2 per plug (VCONN range between 2.7 V to 5.5 V)**

## 7.2 Upstream facing port applications

**Figure 13** shows a CCG2 device being used in a UFP application (tablet with a Type-C port) only as a power consumer.

The Type-C receptacle brings in HighSpeed and SuperSpeed lines, which are connected directly to the applications processor. The VBUS line from the Type-C receptacle goes directly to the UFP (tablet) charger circuitry. The applications processor communicates over the I<sup>2</sup>C signal with the CCG2 device, and the CC1 and CC2 lines from the Type-C receptacle are connected directly to the respective CC1/2 pins of the CCG2 device.

**Figure 13** Upstream facing port (UFP) application – Tablet with a Type-C port

### 7.3 Notebook applications

**Figure 14** shows a Notebook DRP application diagram using a CCG2 device. The Type-C port can be used as a power provider or a power consumer. The CCG2 device communicates with the embedded controller (EC) over I<sup>2</sup>C. It also controls the Data MUX to route the High Speed signals either to the USB chipset (during Normal mode) or the DisplayPort Chipset (during Alternate mode). The SBU lines, SuperSpeed and HighSpeed lines are routed directly from the Display MUX of the notebook to the Type-C receptacle.

Optional FETs are provided for applications that need to provide power for accessories and cables using the VCONN pin of the Type-C receptacle. VBUS FETs are also used for providing power over VBUS and for consuming power over VBUS. A VBUS\_DISCHARGE FET controlled by CCG2 device is used to quickly discharge VBUS after the Type-C connection is detached.

**Figure 14** Dual role port (DRP) application (not recommended for new designs)

## 7.4 Downstream facing port applications

**Figure 15** shows a CCG2 receptacle-based Power Adapter application in which the CCG2 device is used as a DFP. CCG2 integrates all termination resistors and uses GPIOs (VSEL\_0 and VSEL\_1) to indicate the negotiated power profile. The VBUS voltage on the Type-C port is monitored using internal ADC to detect undervoltage and overvoltage conditions on VBUS. To ensure quick discharge of VBUS when the power adapter cable is detached, a discharge path is also provided.

**Figure 15** Downstream facing port (DFP) application

CCG2 is not recommended for new designs of Type-C to video dongles. CCG3 offers a much more integrated solution for this application and also supports PD3.0. Refer the [CCG3 datasheet](#) for more details. This section is just maintained for legacy purposes only.

#### Note

- Usage of the absolute maximum conditions listed in **Table 3** may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150°C in compliance with JEDEC standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

## Electrical specifications

## 8.2 Device level specifications

All specifications are valid for  $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$  and  $T_J \leq 100^{\circ}\text{C}$ , except where noted. Specifications are valid for 3.0 V to 5.5 V, except where noted.

**Table 4 DC specifications**

| Spec ID      | Parameter          | Description                                                                    | Min  | Typ | Max | Unit | Details/conditions    |

## Electrical specifications

### 8.3 Digital peripherals

The following specifications apply to the Timer/Counter/PWM peripherals in the Timer mode.

#### 8.3.1 Pulse width modulation (PWM) for GPIO pins

**Table 9 PWM AC specifications**

(Guaranteed by characterization)

| Spec ID      | Parameter      | Description                  | Min | Typ     | Max | Unit | Details/conditions                                                                           |
|--------------|----------------|------------------------------|-----|---------|-----|------|----------------------------------------------------------------------------------------------|
| SID.TCPWM.3  | $T_{CPWMFREQ}$ | Operating frequency          | –   | $F_C$   | –   | MHz  | $F_C \text{ max} = CLK\_SYS$<br>Maximum = 48 MHz                                             |
| SID.TCPWM.4  | $T_{PWMENEXT}$ | Input trigger pulse width    | –   | $2/F_C$ | –   | ns   | For all trigger events                                                                       |
| SID.TCPWM.5  | $T_{PWMEXT}$   | Output trigger pulse width   | –   | $2/F_C$ | –   |      | Minimum possible width of overflow, underflow, and CC (counter equals compare value) outputs |
| SID.TCPWM.5A | $T_{CRES}$     | Resolution of counter        | –   | $1/F_C$ | –   |      | Minimum time between successive counts                                                       |
| SID.TCPWM.5B | $PWM_{RES}$    | PWM resolution               | –   | $1/F_C$ | –   |      | Minimum pulse width of PWM output                                                            |
| SID.TCPWM.5C | $Q_{RES}$      | Quadrature inputs resolution | –   | $1/F_C$ | –   |      | Minimum pulse width between quadrature-phase inputs                                          |

#### 8.3.2 I<sup>2</sup>C

**Table 10 Fixed I<sup>2</sup>C DC specifications**

(Guaranteed by characterization)

| Spec ID | Parameter  | Description                                 | Min | Typ | Max | Unit    | Details/conditions |
|---------|------------|---------------------------------------------|-----|-----|-----|---------|--------------------|
| SID149  | $I_{I2C1}$ | Block current consumption at 100 kbps       | –   | –   | 60  | $\mu A$ | –                  |
| SID150  | $I_{I2C2}$ | Block current consumption at 400 kbps       | –   | –   | 185 |         | –                  |
| SID151  | $I_{I2C3}$ | Block current consumption at 1 Mbps         | –   | –   | 390 |         | –                  |
| SID152  | $I_{I2C4}$ | I <sup>2</sup> C enabled in Deep Sleep mode | –   | –   | 1.4 |         | –                  |

**Table 11 Fixed I<sup>2</sup>C AC specifications**

| SID182A   | F <sub>RET2</sub>                      | Flash retention. T <sub>A</sub> ≤ 85 °C, 10 K P/E cycles  | 10    | –   | –   |         |                                |

**Note**

3. It can take as much as 20 milliseconds to write to flash. During this time the device should not be reset, or flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

## Electrical specifications

## 8.5 System resources

### 8.5.1 Power-on-reset (POR) with brownout

**Table 19 Imprecise POR (PRES)**

| Spec ID | Parameter             | Description          | Min  | Typ | Max  | Unit | Details/conditions             |
|---------|-----------------------|----------------------|------|-----|------|------|--------------------------------|
| SID185  | V <sub>RISEIPOR</sub> | Rising trip voltage  | 0.80 | –   | 1.50 | V    | Guaranteed by characterization |

## Electrical specifications

**8.5.6 Analog to digital converter****Table 27 ADC DC specifications**

| Spec ID   | Parameter  | Description                | Min  | Typ | Max | Unit | Details/conditions             |
|-----------|------------|----------------------------|------|-----|-----|------|--------------------------------|
| SID.ADC.1 | Resolution | ADC resolution             | –    | 8   | –   | bits | Guaranteed by characterization |
| SID.ADC.2 | INL        | Integral non-linearity     | –1.5 | –   | 1.5 | LSB  |                                |
| SID.ADC.3 | DNL        | Differential non-linearity | –2.5 | –   | 2.5 |      |                                |
| SID.ADC.4 | Gain error | Gain error                 | –1   | –   | 1   |      |                                |

**Table 28 ADC AC specifications**

| Spec ID   | Parameter | Description                              | Min | Typ | Max | Unit | Details/conditions             |
|-----------|-----------|------------------------------------------|-----|-----|-----|------|--------------------------------|
| SID.ADC.5 | SLEW_Max  | Rate of change of sampled voltage signal | –   | –   | 3   | V/ms | Guaranteed by characterization |

## 9 Ordering information

The EZ-PD™ CCG2 part numbers and features are listed in [Table 29](#).

**Table 29 EZ-PD CCG2 ordering Information**

| Product <sup>[4]</sup> | Application  | Type-C ports | Termination resistor                                | Role                                         | Package     |
|------------------------|--------------|--------------|-----------------------------------------------------|----------------------------------------------|-------------|
| CYPD2104-20FNXIT       | Accessory    | 1            | R <sub>P</sub> , R <sub>D</sub> , R <sub>D-DB</sub> | I <sup>2</sup> C bootloader only             | 20-ball CSP |
| CYPD2105-20FNXIT       | Active Cable |              | R <sub>A</sub>                                      | EMCA CC bootloader with application firmware | 20-ball CSP |
| CYPD2122-24LQXI        | Notebook     |              | R <sub>P</sub> , R <sub>D</sub> , R <sub>D-DB</sub> | I <sup>2</sup> C bootloader only             | 24L QFN     |
| CYPD2122-24LQXIT       | Notebook     |              | R <sub>P</sub> , R <sub>D</sub> , R <sub>D-DB</sub> |                                              | 24L QFN     |
| CYPD2134-24LQXQT       | DFP          |              | R <sub>P</sub>                                      | DFP CC bootloader only                       | 24L QFN     |

### 9.1 Ordering code definitions

| CY | PD | 2 | 1 | X | X | - | XX | XX | X | I | T |                                                                                                 |
|----|----|---|---|---|---|---|----|----|---|---|---|-------------------------------------------------------------------------------------------------|

## 11 Acronyms

**Table 33** Acronyms used in this document

| Acronym                  | Description                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------|
| ADC                      | analog-to-digital converter                                                                                   |
| API                      | application programming interface                                                                             |
| ARM®                     | advanced RISC machine, a CPU architecture                                                                     |
| CC                       | configuration channel                                                                                         |
| CCG2                     | Cable Controller Generation 2                                                                                 |
| CPU                      | central processing unit                                                                                       |
| CRC                      | cyclic redundancy check, an error-checking protocol                                                           |
| CS                       | current sense                                                                                                 |
| DFP                      | downstream facing port                                                                                        |
| DIO                      | digital input/output, GPIO with only digital capabilities, no analog. See GPIO.                               |
| DRP                      | dual role port                                                                                                |
| EEPROM                   | electrically erasable programmable read-only memory                                                           |
| EMCA                     | a USB cable that includes an IC that reports cable characteristics (e.g., current rating) to the Type-C ports |
| EMI                      | electromagnetic interference                                                                                  |
| ESD                      | electrostatic discharge                                                                                       |
| FPB                      | flash patch and breakpoint                                                                                    |
| FS                       | full-speed                                                                                                    |
| GPIO                     | general-purpose input/output                                                                                  |
| IC                       | integrated circuit                                                                                            |
| IDE                      | integrated development environment                                                                            |
| I <sup>2</sup> C, or IIC | Inter-Integrated Circuit, a communications protocol                                                           |
| ILO                      | internal low-speed oscillator, see also IMO                                                                   |
| IMO                      | internal main oscillator, see also ILO                                                                        |
| I/O                      | input/output, see also GPIO                                                                                   |
| LVD                      | low-voltage detect                                                                                            |
| LVTTL                    | low-voltage transistor-transistor logic                                                                       |
| MAC                      | managed active cable                                                                                          |
| MCU                      | microcontroller unit                                                                                          |
| NC                       | no connect                                                                                                    |
| NMI                      | nonmaskable interrupt                                                                                         |
| NVIC                     | nested vectored interrupt controller                                                                          |
| opamp                    | operational amplifier                                                                                         |
| OCP                      | overcurrent protection                                                                                        |
| OVP                      | overvoltage protection                                                                                        |
| PCB                      | printed circuit board                                                                                         |
| PD                       | power delivery                                                                                                |

## Acronyms

**Table 33** Acronyms used in this document *(continued)*

| Acronym | Description                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------------------|
| PGA     | programmable gain amplifier                                                                                  |
| PHY     | physical layer                                                                                               |
| POR     | power-on-reset                                                                                               |
| PRES    | precise power-on reset                                                                                       |
| PSoC™   | Programmable System-on-Chip™                                                                                 |
| PWM     | pulse-width modulator                                                                                        |
| RAM     | random-access memory                                                                                         |
| RISC    | reduced-instruction-set computing                                                                            |
| RMS     | root-mean-square                                                                                             |
| RTC     | real-time clock                                                                                              |
| RX      | receive                                                                                                      |
| SAR     | successive approximation register                                                                            |
| SCL     | I <sup>2</sup> C serial clock                                                                                |
| SDA     | I <sup>2</sup> C serial data                                                                                 |
| S/H     | sample and hold                                                                                              |
| SPI     | Serial Peripheral Interface, a communications protocol                                                       |
| SRAM    | static random access memory                                                                                  |
| SWD     | serial wire debug, a test protocol                                                                           |
| TX      | transmit                                                                                                     |
| Type-C  | a new standard with a slimmer USB connector and a reversible cable, capable of sourcing up to 100 W of power |
| UART    | Universal Asynchronous Transmitter Receiver, a communications protocol                                       |
| USB     | Universal Serial Bus                                                                                         |
| USBIO   | USB input/output, CCG2 pins used to connect to a USB port                                                    |
| XRES    | external reset I/O pin                                                                                       |

## 12 Document conventions

### 12.1 Units of measure

**Table 34** Units of measure

| Symbol | Unit of measure        |
|--------|------------------------|
| °C     | degrees Celsius        |
| Hz     | hertz                  |
| KB     | 1024 bytes             |
| kHz    | kilohertz              |
| kΩ     | kilo ohm               |
| Mbps   | megabits per second    |
| MHz    | megahertz              |
| MΩ     | mega-ohm               |
| Msps   | megasamples per second |
| μA     | microampere            |
| μF     | microfarad             |
| μs     | microsecond            |
| μV     | microvolt              |
| μW     | microwatt              |
| mA     | milliampere            |
| ms     | millisecond            |
| mV     | millivolt              |
| nA     | nanoampere             |
| ns     | nanosecond             |
| Ω      | ohm                    |
| pF     | picofarad              |
| ppm    | parts per million      |
| ps     | picosecond             |
| s      | second                 |
| sps    | samples per second     |
| V      | volt                   |

#### **IMPORTANT NOTICE**

The information given in this document shall in no event be regarded as a guarantee of conditions or characteristics ("Beschaffenheitsgarantie").

With respect to any examples, hints or any typical values stated herein and/or any information regarding the application of the product, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

In addition, any information given in this document is subject to customer's compliance with its obligations stated in this document and any applicable legal requirements, norms and standards concerning customer's products and any use of the product of Infineon Technologies in customer's applications.

The data contained in this document is exclusively intended for technically trained staff. It is the responsibility of customer's technical departments to evaluate the suitability of the product for the intended application and the completeness of the product information given in this document with respect to such application.

#### **WARNINGS**

Due to technical requirements products may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies office.

Except as otherwise explicitly approved by Infineon Technologies in a written document signed by authorized representatives of Infineon Technologies, Infineon Technologies' products may not be used in any applications where a failure of the product or any consequences of the use thereof can reasonably be expected to result in personal injury.
