## Electronic Components Sourcing Information

---

### Product Reference Information

**Part Number:** MPC5566MZP144  
**Manufacturer:** NXP USA Inc.  
**Package:** 416-BBGA  
**Availability:** Please confirm with sales

WhatsApp: +86-186-8066-5326

Website: <https://antrexco.com>

### Quality & Trust

New & Original Components

Supplier verification and packaging condition review

CoC / RoHS / REACH documents available on request

Secure sourcing support for OEM / EMS projects

**Note:**

This PDF includes an ANTREX product reference cover page.

The original manufacturer datasheet follows from the next page.

# MPC5566

## Microcontroller Data Sheet

This document provides electrical specifications, pin assignments, and package diagrams for the MPC5566 microcontroller device. For functional characteristics, refer to the *MPC5566 Microcontroller Reference Manual*.

### 1 Overview

The MPC5566 microcontroller (MCU) is a member of the MPC5500 family of microcontrollers built on the Power Architecture® embedded technology. This family of parts has many new features coupled with high performance CMOS technology to provide substantial reduction of cost per feature and significant performance improvement over the MPC500 family.

The host processor core of this device complies with the Power Architecture embedded category that is 100% user-mode compatible (including floating point library) with the original PowerPC instruction set. The embedded architecture enhancements improve the performance in embedded applications. The core also has additional instructions, including digital signal processing (DSP) instructions, beyond the original PowerPC instruction set.

## Overview

The MPC5500 family of parts contains many new features coupled with high performance CMOS technology to provide significant performance improvement over the MPC565x.

The host processor core of the MPC5566 also includes an instruction set enhancement allowing variable length encoding (VLE). This allows optional encoding of mixed 16- and 32-bit instructions. With this enhancement, it is possible to significantly reduce the code size footprint.

The MPC5566 has two levels of memory hierarchy. The fastest accesses are to the 32-kilobytes (KB) unified cache. The next level in the hierarchy contains the 128-KB on-chip internal SRAM and three-megabytes (MB) internal flash memory. The internal SRAM and flash memory hold instructions and data. The external bus interface is designed to support most of the standard memories used with the MPC5xx family.

The complex input/output timer functions of the MPC5566 are performed by two enhanced time processor unit (eTPU) engines. Each eTPU engine controls 32 hardware channels, providing a total of 64 hardware channels. The eTPU has been enhanced over the TPU by providing: 24-bit timers, double-action hardware channels, variable number of parameters per channel, angle clock hardware, and additional control and arithmetic instructions. The eTPU is programmed using a high-level programming language.

The less complex timer functions of the MPC5566 are performed by the enhanced modular input/output system (eMIOS). The eMIOS' 24 hardware channels are capable of single-action, double-action, pulse-width modulation (PWM), and modulus-counter operations. Motor control capabilities include edge-aligned and center-aligned PWM.

Off-chip communication is performed by a suite of serial protocols including controller area networks (FlexCANs), enhanced deserial/serial peripheral interfaces (DSPIs), and enhanced serial communications interfaces (eSCIs). The DSPIs support pin reduction through hardware serialization and deserialization of timer channels and general-purpose input/output (GPIOs) signals.

The MCU has an on-chip enhanced queued dual analog-to-digital converter (eQADC)s 40-channels.

The system integration unit (SIU) performs several chip-wide configuration functions. Pad configuration and general-purpose input and output (GPIO) are controlled from the SIU. External interrupts and reset control are also determined by the SIU. The internal multiplexer submodule provides multiplexing of eQADC trigger sources, daisy chaining the DSPIs, and external interrupt signal multiplexing.

The Fast Ethernet (FEC) module is a RISC-based controller that supports both 10 and 100 Mbps Ethernet/IEEE® 802.3 networks and is compatible with three different standard MAC (media access controller) PHY (physical) interfaces to connect to an external Ethernet bus. The FEC supports the 10 or 100 Mbps MII (media independent interface), and the 10 Mbps-only with a seven-wire interface, which uses a subset of the MII signals. The upper 16-bits of the 32-bit external bus interface (EBI) are used to connect to an external Ethernet device. The FEC contains built-in transmit and receive message FIFOs and DMA support.

## 2 Ordering Information

**Temperature Range**  
M = -40° C to 125° C

**Package Identifier**  
ZP = 416PBGA SnPb  
VR = 416PBGA Pb-free

**Operating Frequency**  
80 = 80 MHz  
112 = 112 MHz  
132 = 132 MHz  
144 = 144 MHz

**Tape and Reel Status**  
R = Tape and reel  
(blank) = Trays

**Qualification Status**  
P = Pre qualification  
M = Fully spec. qualified, general market flow  
S = Fully spec. qualified, automotive flow

**Note:** Not all options are available on all devices. Refer to [Table 1](#).

**Figure 1. MPC5500 Family Part Number Example**

Unless noted in this data sheet, all specifications apply from  $T_L$  to  $T_H$ .

| MPC5566MZP132                      |                                           | 132         | 135                             |                                    |                |
| MPC5566MZP112                      |                                           | 112         | 114                             |                                    |                |
| MPC5566MZP80                       |                                           | 80          | 82                              |                                    |                |

<sup>1</sup> All devices are PPC5566, rather than MPC5566 or SPC5566, until product qualifications are complete. Not all configurations are available in the PPC parts.

<sup>2</sup> The lowest ambient operating temperature is referenced by  $T_L$ ; the highest ambient operating temperature is referenced by  $T_H$ .

<sup>3</sup> Speed is the nominal maximum frequency. Max. speed is the maximum speed allowed including frequency modulation (FM). 82 MHz parts allow for 80 MHz system clock + 2% FM; 114 MHz parts allow for 112 MHz system clock + 2% FM; 135 MHz parts allow for 132 MHz system clock + 2% FM; and 147 MHz parts allow for 144 MHz system clock + 2% FM.

## 3 Electrical Characteristics

This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications for the MCU.

### 3.1 Maximum Ratings

Table 2. Absolute Maximum Ratings <sup>1</sup>

| Spec | Characteristic                                                                                                                        | Symbol               | Min.                                   | Max.                                 | Unit |
|------|---------------------------------------------------------------------------------------------------------------------------------------|----------------------|----------------------------------------|--------------------------------------|------|
| 1    | 1.5 V core supply voltage <sup>2</sup>                                                                                                | $V_{DD}$             | -0.3                                   | 1.7                                  | V    |

Table 2. Absolute Maximum Ratings <sup>1</sup> (continued)

| Spec | Characteristic                                                                   | Symbol           | Min.   | Max.           | Unit |
|------|----------------------------------------------------------------------------------|------------------|--------|----------------|------|
| 28   | Maximum solder temperature <sup>11</sup><br>Lead free (Pb-free)<br>Leaded (SnPb) | T <sub>SDR</sub> | —<br>— | 260.0<br>245.0 | °C   |
| 29   | Moisture sensitivity level <sup>12</sup>                                         | MSL              | —      | 3              |      |

<sup>1</sup> Functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond any of the listed maxima can affect device reliability or cause permanent damage to the device.

<sup>2</sup> 1.5 V ± 10% for proper operation. This parameter is specified at a maximum junction temperature of 150 °C.

<sup>3</sup> All functional non-supply I/O pins are clamped to V<sub>SS</sub> and V<sub>DDE</sub>, or V<sub>DDEH</sub>.

<sup>4</sup> AC signal overshoot and undershoot of up to ± 2.0 V of the input voltages is permitted for an accumulative duration of 60 hours over the complete lifetime of the device (injection current not limited for this duration).

<sup>5</sup> Internal structures hold the voltage greater than –1.0 V if the injection current limit of 2 mA is met. Keep the negative DC voltage greater than –0.6 V on eTPUB[15] and SINB during the internal power-on reset (POR) state.

<sup>6</sup> Internal structures hold the input voltage less than the maximum voltage on all pads powered by V<sub>DDEH</sub> supplies, if the maximum injection current specification is met (2 mA for all pins) and V<sub>DDEH</sub> is within the operating voltage specifications.

<sup>7</sup> Internal structures hold the input voltage less than the maximum voltage on all pads powered by V<sub>DDE</sub> supplies, if the maximum injection current specification is met (2 mA for all pins) and V<sub>DDE</sub> is within the operating voltage specifications.

<sup>8</sup> Total injection current for all pins (including both digital and analog) must not exceed 25 mA.

<sup>9</sup> Total injection current for all analog input pins must not exceed 15 mA.

<sup>10</sup> Lifetime operation at these specification limits is not guaranteed.

<sup>11</sup> Moisture sensitivity profile per IPC/JEDEC J-STD-020D.

<sup>12</sup> Moisture sensitivity per JEDEC test method A112.

## 3.2 Thermal Characteristics

The shaded rows in the following table indicate information specific to a four-layer board.

Table 3. MPC5566 Thermal Characteristics

| Spec | MPC5566 Thermal Characteristic                                                  | Symbol            | 416 PBGA | Unit |
|------|---------------------------------------------------------------------------------|-------------------|----------|------|
| 1    | Junction to ambient, natural convection (one-layer board) <sup>1, 2</sup>       | R <sub>θJA</sub>  | 24       | °C/W |
| 2    | Junction to ambient, natural convection (four-layer board 2s2p) <sup>1, 3</sup> | R <sub>θJA</sub>  | 16       | °C/W |
| 3    | Junction to ambient (@200 ft./min., one-layer board)                            | R <sub>θJMA</sub> | 18       | °C/W |
| 4    | Junction to ambient (@200 ft./min., four-layer board 2s2p)                      | R <sub>θJMA</sub> | 13       | °C/W |
| 5    | Junction to board (four-layer board 2s2p) <sup>4</sup>                          | R <sub>θJB</sub>  | 8        | °C/W |
| 6    | Junction to case <sup>5</sup>                                                   | R <sub>θJC</sub>  | 6        | °C/W |
| 7    | Junction to package top, natural convection <sup>6</sup>                        | Ψ <sub>JT</sub>   | 2        | °C/W |

<sup>1</sup> Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other board components, and board thermal resistance.

<sup>2</sup> Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.

<sup>3</sup> Per JEDEC JESD51-6 with the board horizontal.

<sup>4</sup> Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

<sup>5</sup> Indicates the average thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1) with the cold plate temperature used for the case temperature.

<sup>6</sup> Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

### 3.2.1 General Notes for Specifications at Maximum Junction Temperature

An estimation of the device junction temperature,  $T_J$ , can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

$T_A$  = ambient temperature for the package ( $^{\circ}\text{C}$ )

$R_{\theta JA}$  = junction to ambient thermal resistance ( $^{\circ}\text{C}/\text{W}$ )

$P_D$  = power dissipation in the package (W)

The thermal resistance values used are based on the JEDEC JESD51 series of standards to provide consistent values for estimations and comparisons. The difference between the values determined for the single-layer (1s) board compared to a four-layer board that has two signal layers, a power and a ground plane (2s2p), demonstrate that the effective thermal resistance is not a constant. The thermal resistance depends on the:

- Construction of the application board (number of planes)
- Effective size of the board which cools the component
- Quality of the thermal and electrical connections to the planes
- Power dissipated by adjacent components

Connect all the ground and power balls to the respective planes with one via per ball. Using fewer vias to connect the package to the planes reduces the thermal performance. Thinner planes also reduce the thermal performance. When the clearance between the vias leave the planes virtually disconnected, the thermal performance is also greatly reduced.

As a general rule, the value obtained on a single-layer board is within the normal range for the tightly packed printed circuit board. The value obtained on a board with the internal planes is usually within the normal range if the application board has:

- One oz. (35 micron nominal thickness) internal planes
- Components are well separated
- Overall power dissipation on the board is less than  $0.02 \text{ W}/\text{cm}^2$

The thermal performance of any component depends on the power dissipation of the surrounding components. In addition, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device.

At a known board temperature, the junction temperature is estimated using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$T_J$  = junction temperature ( $^{\circ}\text{C}$ )

$T_B$  = board temperature at the package perimeter ( $^{\circ}\text{C/W}$ )

$R_{\theta JB}$  = junction-to-board thermal resistance ( $^{\circ}\text{C/W}$ ) per JESD51-8

$P_D$  = power dissipation in the package (W)

When the heat loss from the package case to the air does not factor into the calculation, an acceptable value for the junction temperature is predictable. Ensure the application board is similar to the thermal test condition, with the component soldered to a board with internal planes.

The thermal resistance is expressed as the sum of a junction-to-case thermal resistance plus a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$  = junction-to-ambient thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta JC}$  = junction-to-case thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta CA}$  = case-to-ambient thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta JC}$  is device related and is not affected by other factors. The thermal environment can be controlled to change the case-to-ambient thermal resistance,  $R_{\theta CA}$ . For example, change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This description is most useful for packages with heat sinks where 90% of the heat flow is through the case to heat sink to ambient. For most packages, a better model is required.

A more accurate two-resistor thermal model can be constructed from the junction-to-board thermal resistance and the junction-to-case thermal resistance. The junction-to-case thermal resistance describes when using a heat sink or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. This model can be used to generate simple estimations and for computational fluid dynamics (CFD) thermal models.

To determine the junction temperature of the device in the application on a prototype board, use the thermal characterization parameter ( $\Psi_{JT}$ ) to determine the junction temperature by measuring the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

$T_T$  = thermocouple temperature on top of the package ( $^{\circ}\text{C}$ )

$\Psi_{JT}$  = thermal characterization parameter ( $^{\circ}\text{C/W}$ )

$P_D$  = power dissipation in the package (W)

## Electrical Characteristics

The thermal characterization parameter is measured in compliance with the JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. Position the thermocouple so that the thermocouple junction rests on the package. Place a small amount of epoxy on the thermocouple junction and approximately 1 mm of wire extending from the junction. Place the thermocouple wire flat against the package case to avoid measurement errors caused by the cooling effects of the thermocouple wire.

<sup>1</sup> All ESD testing conforms to CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

<sup>2</sup> Device failure is defined as: 'If after exposure to ESD pulses, the device does not meet the device specification requirements, which includes the complete DC parametric and functional testing at room temperature and hot temperature.'

### 3.6 Voltage Regulator Controller ( $V_{RC}$ ) and Power-On Reset (POR) Electrical Specifications

The following table lists the  $V_{RC}$  and POR electrical specifications:

Table 6.  $V_{RC}$  and POR Electrical Specifications

| Spec | Characteristic                                                                                                                                                                               |                                                                                                                         | Symbol                    | Min.                     | Max.                         | Units          |

**Table 6.  $V_{RC}$  and POR Electrical Specifications (continued)**

| Spec | Characteristic                                                                                  | Symbol             | Min.           | Max.          | Units       |
|------|-------------------------------------------------------------------------------------------------|--------------------|----------------|---------------|-------------|
| 9    | Absolute value of slew rate on power supply pins                                                | —                  | —              | 50            | V/ms        |
| 10   | Required gain at Tj:<br>$I_{DD} \div I_{VRCCTL}$ (@ $f_{sys} = f_{MAX}$ ) <sup>6, 7, 8, 9</sup> | BETA <sup>10</sup> | 60<br>65<br>85 | —<br>—<br>500 | —<br>—<br>— |
|      | – 40° C<br>25° C<br>150° C                                                                      |                    |                |               |             |

<sup>1</sup> The internal POR signals are  $V_{POR15}$ ,  $V_{POR33}$ , and  $V_{POR5}$ . On power up, assert  $\overline{RESET}$  before the internal POR negates.  $\overline{RESET}$  must remain asserted until the power supplies are within the operating conditions as specified in [Table 9](#) DC Electrical Specifications. On power down, assert  $\overline{RESET}$  before any power supplies fall outside the operating conditions and until the internal POR asserts.

<sup>2</sup>  $V_{IL\_S}$  ([Table 9](#), Spec15) is guaranteed to scale with  $V_{DDEH6}$  down to  $V_{POR5}$ .

<sup>3</sup> Supply full operating current for the 1.5 V supply when the 3.3 V supply reaches this range.

<sup>4</sup> It is possible to reach the current limit during ramp up—do not treat this event as short circuit current.

<sup>5</sup> At peak current for device.

<sup>6</sup> Requires compliance with Freescale's recommended board requirements and transistor recommendations. Board signal traces/routing from the  $V_{RCCTL}$  package signal to the base of the external pass transistor and between the emitter of the pass transistor to the  $V_{DD}$  package signals must have a maximum of 100 nH inductance and minimal resistance (less than 1  $\Omega$ ).  $V_{RCCTL}$  must have a nominal 1  $\mu$ F phase compensation capacitor to ground.  $V_{DD}$  must have a 20  $\mu$ F (nominal) bulk capacitor (greater than 4  $\mu$ F over all conditions, including lifetime). Place high-frequency bypass capacitors consisting of eight 0.01  $\mu$ F, two 0.1  $\mu$ F, and one 1  $\mu$ F capacitors around the package on the  $V_{DD}$  supply signals.

<sup>7</sup>  $I_{VRCCTL}$  is measured at the following conditions:  $V_{DD} = 1.35$  V,  $V_{RC33} = 3.1$  V,  $V_{VRCCTL} = 2.2$  V.

<sup>8</sup> Refer to [Table 1](#) for the maximum operating frequency.

<sup>9</sup> Values are based on  $I_{DD}$  from high-use applications as explained in the  $I_{DD}$  Electrical Specification.

<sup>10</sup> BETA represents the worst-case external transistor. It is measured on a per-part basis and calculated as  $(I_{DD} \div I_{VRCCTL})$ .

## 3.7 Power-Up/Down Sequencing

Power sequencing between the 1.5 V power supply and  $V_{DDSYN}$  or the  $\overline{RESET}$  power supplies is required if using an external 1.5 V power supply with  $V_{RC33}$  tied to ground (GND). To avoid power-sequencing,  $V_{RC33}$  must be powered up within the specified operating range, even if the on-chip voltage regulator controller is not used. Refer to [Section 3.7.2, “Power-Up Sequence \(VRC33 Grounded\),”](#) and [Section 3.7.3, “Power-Down Sequence \(VRC33 Grounded\).”](#)

Power sequencing requires that  $V_{DD33}$  must reach a certain voltage where the values are read as ones before the POR signal negates. Refer to [Section 3.7.1, “Input Value of Pins During POR Dependent on VDD33.”](#)

Although power sequencing is not required between  $V_{RC33}$  and  $V_{DDSYN}$  during power up,  $V_{RC33}$  must not lead  $V_{DDSYN}$  by more than 600 mV or lag by more than 100 mV for the  $V_{RC}$  stage turn-on to operate within specification. Higher spikes in the emitter current of the pass transistor occur if  $V_{RC33}$  leads or lags  $V_{DDSYN}$  by more than these amounts. The value of that higher spike in current depends on the board power supply circuitry and the amount of board level capacitance.

Furthermore, when all of the PORs negate, the system clock starts to toggle, adding another large increase of the current consumed by  $V_{RC33}$ . If  $V_{RC33}$  lags  $V_{DDSYN}$  by more than 100 mV, the increase in current consumed can drop  $V_{DD}$  low enough to assert the 1.5 V POR again. Oscillations are possible when the

1.5 V POR asserts and stops the system clock, causing the voltage on  $V_{DD}$  to rise until the 1.5 V POR negates again. All oscillations stop when  $V_{RC33}$  is powered sufficiently.

When powering down,  $V_{RC33}$  and  $V_{DDSYN}$  have no delta requirement to each other, because the bypass capacitors internal and external to the device are already charged. When not powering up or down, no delta between  $V_{RC33}$  and  $V_{DDSYN}$  is required for the  $V_{RC}$  to operate within specification.

There are no power up/down sequencing requirements to prevent issues such as latch-up, excessive current spikes, and so on. Therefore, the state of the I/O pins during power up and power down varies depending on which supplies are powered.

Table 7 gives the pin state for the sequence cases for all pins with pad type pad\_fc (fast type).

**Table 7. Pin Status for Fast Pads During the Power Sequence**

| $V_{DDE}$ | $V_{DD33}$ | $V_{DD}$ | POR      | Pin Status for Fast Pad Output Driver<br>pad_fc (fast) |
|-----------|------------|----------|----------|--------------------------------------------------------|
| Low       | —          | —        | Asserted | Low                                                    |
| $V_{DDE}$ | Low        | Low      | Asserted | High                                                   |
| $V_{DDE}$ | Low        | $V_{DD}$ | Asserted | High                                                   |
| $V_{DDE}$ | $V_{DD33}$ | Low      | Asserted | High impedance (Hi-Z)                                  |
| $V_{DDE}$ | $V_{DD33}$ | $V_{DD}$ | Asserted | Hi-Z                                                   |
| $V_{DDE}$ | $V_{DD33}$ | $V_{DD}$ | Negated  | Functional                                             |

Table 8 gives the pin state for the sequence cases for all pins with pad type pad\_mh (medium type) and pad\_sh (slow type).

**Table 8. Pin Status for Medium and Slow Pads During the Power Sequence**

| $V_{DDEH}$ | $V_{DD}$ | POR      | Pin Status for Medium and Slow Pad Output Driver<br>pad_mh (medium) pad_sh (slow) |
|------------|----------|----------|-----------------------------------------------------------------------------------|
| Low        | —        | Asserted | Low                                                                               |
| $V_{DDEH}$ | Low      | Asserted | High impedance (Hi-Z)                                                             |
| $V_{DDEH}$ | $V_{DD}$ | Asserted | Hi-Z                                                                              |
| $V_{DDEH}$ | $V_{DD}$ | Negated  | Functional                                                                        |

The values in Table 7 and Table 8 do not include the effect of the weak-pull devices on the output pins during power up.

Before exiting the internal POR state, the voltage on the pins go to a high-impedance state until POR negates. When the internal POR negates, the functional state of the signal during reset applies and the weak-pull devices

(up or down) are enabled as defined in the device reference manual. If  $V_{DD}$  is too low to correctly propagate the logic signals, the weak-pull devices can pull the signals to  $V_{DDE}$  and  $V_{DDEH}$ .

To avoid this condition, minimize the ramp time of the  $V_{DD}$  supply to a time period less than the time required to enable the external circuitry connected to the device outputs.

## Electrical Characteristics

During initial power ramp-up, when  $V_{\text{stby}}$  is 0.6v or above, a typical current of 1-3mA and maximum of 4mA may be seen until  $V_{\text{DD}}$  is applied. This current will not reoccur until  $V_{\text{stby}}$  is lowered below  $V_{\text{stby}}$  min. specification.

Figure 2 shows an approximate interpolation of the  $I_{\text{STBY}}$  worst-case specification to estimate values at different voltages and temperatures. The vertical lines shown at 25 °C, 60 °C, and 150 °C in Figure 2 are the actual  $I_{\text{DD\_STBY}}$  specifications (27d) listed in Table 9.

Figure 2.  $I_{\text{STBY}}$  Worst-case Specifications

### 3.7.1 Input Value of Pins During POR Dependent on $V_{DD33}$

When powering up the device,  $V_{DD33}$  must not lag the latest  $V_{DDSYN}$  or  $\overline{RESET}$  power pin ( $V_{DDEH6}$ ) by more than the  $V_{DD33}$  lag specification listed in Table 6, spec 8. This avoids accidentally selecting the bypass clock mode because the internal versions of PLLCFG[0:1] and  $\overline{RSTCFG}$  are not powered and therefore cannot read the default state when POR negates.  $V_{DD33}$  can lag  $V_{DDSYN}$  or the  $\overline{RESET}$  power pin ( $V_{DDEH6}$ ), but cannot lag both by more than the  $V_{DD33}$  lag specification. This  $V_{DD33}$  lag specification applies during power up only.  $V_{DD33}$  has no lead or lag requirements when powering down.

### 3.7.2 Power-Up Sequence ( $V_{RC33}$ Grounded)

The 1.5 V  $V_{DD}$  power supply must rise to 1.35 V before the 3.3 V  $V_{DDSYN}$  power supply and the  $\overline{RESET}$  power supply rises above 2.0 V. This ensures that digital logic in the PLL for the 1.5 V power supply does not begin to operate below the specified operation range lower limit of 1.35 V. Because the internal 1.5 V POR is disabled, the internal 3.3 V POR or the  $\overline{RESET}$  power POR must hold the device in reset. Since they can negate as low as 2.0 V,  $V_{DD}$  must be within specification before the 3.3 V POR and the  $\overline{RESET}$  POR negate.

Figure 3. Power-Up Sequence ( $V_{RC33}$  Grounded)

### 3.7.3 Power-Down Sequence ( $V_{RC33}$ Grounded)

The only requirement for the power-down sequence with  $V_{RC33}$  grounded is if  $V_{DD}$  decreases to less than its operating range,  $V_{DDSYN}$  or the  $\overline{RESET}$  power must decrease to less than 2.0 V before the  $V_{DD}$  power increases to its operating range. This ensures that the digital 1.5 V logic, which is reset only by an OREd POR and can cause the 1.5 V supply to decrease less than its specification value, resets correctly. See Table 6, footnote 1.

## 3.8 DC Electrical Specifications

Table 9. DC Electrical Specifications ( $T_A = T_L$  to  $T_H$ )

| Spec | Characteristic                                                                                                                 | Symbol       | Min                                              | Max.                                             | Unit                 |
|------|--------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------------------------|--------------------------------------------------|----------------------|
| 1    | Core supply voltage (average DC RMS voltage)                                                                                   | $V_{DD}$     | 1.35                                             | 1.65                                             | V                    |
| 2    | Input/output supply voltage (fast input/output) <sup>1</sup>                                                                   | $V_{DDE}$    | 1.62                                             | 3.6                                              | V                    |
| 3    | Input/output supply voltage (slow and medium input/output)                                                                     | $V_{DDEH}$   | 3.0                                              | 5.25                                             | V                    |
| 4    | 3.3 V input/output buffer voltage                                                                                              | $V_{DD33}$   | 3.0                                              | 3.6                                              | V                    |
| 5    | Voltage regulator control input voltage                                                                                        | $V_{RC33}$   | 3.0                                              | 3.6                                              | V                    |
| 6    | Analog supply voltage <sup>2</sup>                                                                                             | $V_{DDA}$    | 4.5                                              | 5.25                                             | V                    |
| 8    | Flash programming voltage <sup>3</sup>                                                                                         | $V_{PP}$     | 4.5                                              | 5.25                                             | V                    |
| 9    | Flash read voltage                                                                                                             | $V_{FLASH}$  | 3.0                                              | 3.6                                              | V                    |
| 10   | SRAM standby voltage <sup>4</sup>                                                                                              | $V_{STBY}$   | 0.8                                              | 1.2                                              | V                    |
| 11   | Clock synthesizer operating voltage                                                                                            | $V_{DDSYN}$  | 3.0                                              | 3.6                                              | V                    |
| 12   | Fast I/O input high voltage                                                                                                    | $V_{IH\_F}$  | $0.65 \times V_{DDE}$                            | $V_{DDE} + 0.3$                                  | V                    |
| 13   | Fast I/O input low voltage                                                                                                     | $V_{IL\_F}$  | $V_{SS} - 0.3$                                   | $0.35 \times V_{DDE}$                            | V                    |
| 14   | Medium and slow I/O input high voltage                                                                                         | $V_{IH\_S}$  | $0.65 \times V_{DDEH}$                           | $V_{DDEH} + 0.3$                                 | V                    |
| 15   | Medium and slow I/O input low voltage                                                                                          | $V_{IL\_S}$  | $V_{SS} - 0.3$                                   | $0.35 \times V_{DDEH}$                           | V                    |

| 41   | $V_{SSSYN}$ to $V_{SS}$ differential voltage                    | $V_{SSSYN} - V_{SS}$          | -50   | 50                | mV   |
| 42   | $V_{RCVSS}$ to $V_{SS}$ differential voltage                    | $V_{RCVSS} - V_{SS}$          | -50   | 50                | mV   |
| 43   | $V_{DDF}$ to $V_{DD}$ differential voltage                      | $V_{DDF} - V_{DD}$            | -100  | 100               | mV   |
| 43a  | $V_{RC33}$ to $V_{DDSYN}$ differential voltage                  | $V_{RC33} - V_{DDSYN}$        | -0.1  | 0.1 <sup>19</sup> | V    |
| 44   | Analog input differential signal range (with common mode 2.5 V) | $V_{IDIFF}$                   | -2.5  | 2.5               | V    |
| 45   | Operating temperature range, ambient (packaged)                 | $T_A = (T_L \text{ to } T_H)$ | $T_L$ | $T_H$             | °C   |
| 46   | Slew rate on power-supply pins                                  | —                             | —     | 50                | V/ms |

<sup>1</sup>  $V_{DDE2}$  and  $V_{DDE3}$  are limited to 2.25–3.6 V only if  $SIU\_ECCR[EBTS] = 0$ ;  $V_{DDE2}$  and  $V_{DDE3}$  have a range of 1.6–3.6 V if  $SIU\_ECCR[EBTS] = 1$ .

<sup>2</sup>  $|V_{DDA0} - V_{DDA1}|$  must be  $< 0.1$  V.

<sup>3</sup>  $V_{PP}$  can drop to 3.0 V during read operations.

<sup>4</sup> If standby operation is not required, connect  $V_{STBY}$  to ground.

<sup>5</sup> Applies to CLKOUT, external bus pins, and Nexus pins.

<sup>6</sup> Maximum average RMS DC current.

<sup>7</sup> Eight-way cache enabled ( $L1CSR0[CORG] = 0b0$ ).

<sup>8</sup> Average current measured on automotive benchmark.

<sup>9</sup> Peak currents can be higher on specialized code.

<sup>10</sup> High use current measured while running optimized SPE assembly code with all code and data 100% locked in cache (0% miss rate) with all channels of the eMIOS and eTPU running autonomously, plus the eDMA transferring data continuously from SRAM to SRAM. Higher currents are possible if an 'idle' loop that crosses cache lines is run from cache. Write code to avoid this condition.

<sup>11</sup> Four-way cache enabled ( $L1CSR0[CORG] = 0b1$ ) or ( $L1CSR0[CORG] = 0b0$  with  $L1CSR0[WAM] = 0b1$ ,  $L1CSR0[WDI] = 0b1111$ ,  $L1CSR0[WDD] = 0b1111$ ,  $L1CSR0[AWID] = 0b1$ , and  $L1CSR0[AWDD] = 0b1$ ).

<sup>12</sup> The current specification relates to average standby operation after SRAM has been loaded with data. For power up current see [Section 3.7, "Power-Up/Down Sequencing"](#), [Figure 2](#).

<sup>13</sup> Power requirements for the  $V_{DD33}$  supply depend on the frequency of operation, load of all I/O pins, and the voltages on the I/O segments. Refer to [Table 11](#) for values to calculate the power dissipation for a specific operation.

<sup>14</sup> Power requirements for each I/O segment are dependent on the frequency of operation and load of the I/O pins on a particular I/O segment, and the voltage of the I/O segment. Refer to [Table 10](#) for values to calculate power dissipation for specific operation. The total power consumption of an I/O segment is the sum of the individual power consumptions for each pin on the segment.

<sup>15</sup> Absolute value of current, measured at  $V_{IL}$  and  $V_{IH}$ .

<sup>16</sup> Weak pullup/down inactive. Measured at  $V_{DDE} = 3.6$  V and  $V_{DDEH} = 5.25$  V. Applies to pad types: pad\_fc, pad\_sh, and pad\_mh.

<sup>17</sup> Maximum leakage occurs at maximum operating temperature. Leakage current decreases by approximately one-half for each 8 °C to 12 °C, in the ambient temperature range of 50 °C to 125 °C. Applies to pad types: pad\_a and pad\_ae.

<sup>18</sup>  $V_{SSA}$  refers to both  $V_{SSA0}$  and  $V_{SSA1}$ .  $|V_{SSA0} - V_{SSA1}|$  must be  $< 0.1$  V.

<sup>19</sup> Up to 0.6 V during power up and power down.

### 3.8.1 I/O Pad Current Specifications

The power consumption of an I/O segment depends on the usage of the pins on a particular segment. The power consumption is the sum of all output pin currents for a segment. The output pin current can be calculated from Table 10 based on the voltage, frequency, and load on the pin. Use linear scaling to calculate pin currents for voltage, frequency, and load parameters that fall outside the values given in Table 10.

**Table 10. I/O Pad Average DC Current ( $T_A = T_L$  to  $T_H$ )<sup>1</sup>**

| Spec | Pad Type | Symbol        | Frequency (MHz) | Load <sup>2</sup> (pF) | Voltage (V) | Drive Select / Slew Rate Control Setting | Current (mA) |
|------|----------|---------------|-----------------|------------------------|-------------|------------------------------------------|--------------|
| 1    | Slow     | $I_{DRV\_SH}$ | 25              | 50                     | 5.25        | 11                                       | 8.0          |
| 2    |          |               | 10              | 50                     | 5.25        | 01                                       | 3.2          |
| 3    |          |               | 2               | 50                     | 5.25        | 00                                       | 0.7          |

| 32   |          |               | 40              | 50                     | 1.98        | 11                                       | 4.0          |

<sup>1</sup> These values are estimates from simulation and are not tested. Currents apply to output pins only.

<sup>2</sup> All loads are lumped.

### 3.8.2 I/O Pad $V_{DD33}$ Current Specifications

The power consumption of the  $V_{DD33}$  supply depends on the usage of the pins on all I/O segments. The power consumption is the sum of all input and output pin  $V_{DD33}$  currents for all I/O segments. The output pin  $V_{DD33}$  current can be calculated from Table 11 based on the voltage, frequency, and load on all fast (pad\_fc) pins. The input pin  $V_{DD33}$  current can be calculated from Table 11 based on the voltage, frequency, and load on all pad\_sh and pad\_mh pins. Use linear scaling to calculate pin currents for voltage, frequency, and load parameters that fall outside the values given in Table 11.

**Table 11.  $V_{DD33}$  Pad Average DC Current ( $T_A = T_L$  to  $T_H$ )<sup>1</sup>**

| Spec           | Pad Type | Symbol       | Frequency (MHz) | Load <sup>2</sup> (pF) | $V_{DD33}$ (V) | $V_{DDE}$ (V) | Drive Select | Current (mA) |
|----------------|----------|--------------|-----------------|------------------------|----------------|---------------|--------------|--------------|
| <b>Inputs</b>  |          |              |                 |                        |                |               |              |              |
| 1              | Slow     | $I_{33\_SH}$ | 66              | 0.5                    | 3.6            | 5.5           | NA           | 0.003        |

| 22   | Predivider output frequency (to PLL)                                                                                                                                     | $f_{PREDIV}$ | 4       | 20 <sup>17</sup> | MHz               |

<sup>1</sup> Nominal crystal and external reference values are worst-case not more than 1%. The device operates correctly if the frequency remains within  $\pm 5\%$  of the specification limit. This tolerance range allows for a slight frequency drift of the crystals over time. The designer must thoroughly understand the drift margin of the source clock.

<sup>2</sup> All internal registers retain data at 0 Hz.

<sup>3</sup> Up to the maximum frequency rating of the device (refer to Table 1).

<sup>4</sup> Loss of reference frequency is defined as the reference frequency detected internally, which transitions the PLL into self-clocked mode.

<sup>5</sup> The PLL operates at self-clocked mode (SCM) frequency when the reference frequency falls below  $f_{LOR}$ . SCM frequency is measured on the CLKOUT ball with the divider set to divide-by-two of the system clock.

NOTE: In SCM, the MFD and PREDIV have no effect and the RFD is bypassed.

<sup>6</sup> Use the EXTAL input high voltage parameter when using the FlexCAN oscillator in crystal mode (no quartz crystals or resonators). ( $V_{extal} - V_{xtal}$ ) must be  $\geq 400\text{ mV}$  for the oscillator's comparator to produce the output clock.

<sup>7</sup> Use the EXTAL input low voltage parameter when using the FlexCAN oscillator in crystal mode (no quartz crystals or resonators). ( $V_{xtal} - V_{extal}$ ) must be  $\geq 400\text{ mV}$  for the oscillator's comparator to produce the output clock.

<sup>8</sup>  $I_{xtal}$  is the oscillator bias current out of the XTAL pin with both EXTAL and XTAL pins grounded.

<sup>9</sup>  $C_{PCB\_EXTAL}$  and  $C_{PCB\_XTAL}$  are the measured PCB stray capacitances on EXTAL and XTAL, respectively.

<sup>10</sup> This specification applies to the period required for the PLL to relock after changing the MFD frequency control bits in the synthesizer control register (SYNCR). From power up with crystal oscillator reference, the lock time also includes the crystal startup time.

<sup>11</sup> PLL is operating in 1:1 PLL mode.

<sup>12</sup>  $V_{DDE} = 3.0\text{--}3.6\text{ V}$ .

<sup>13</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{SYS}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via  $V_{DDSYN}$  and  $V_{SSSYN}$  and variation in crystal oscillator frequency increase the jitter percentage for a given interval. CLKOUT divider is set to divide-by-two.

<sup>14</sup> Values are with frequency modulation disabled. If frequency modulation is enabled, jitter is the sum of (jitter + Cmod).

<sup>15</sup> Modulation depth selected must not result in  $f_{SYS}$  value greater than the  $f_{SYS}$  maximum specified value.

<sup>16</sup>  $f_{SYS} = f_{ICO} \div (2^{RFD})$ .

<sup>17</sup> Maximum value for dual controller (1:1) mode is ( $f_{MAX} \div 2$ ) with the predivider set to 1 (FMPLL\_SYNCR[PREDIV] = 0b001).

### 3.10 eQADC Electrical Characteristics

Table 13. eQADC Conversion Specifications ( $T_A = T_L$  to  $T_H$ )

| Spec | Characteristic                                                                                                                                                                              | Symbol      | Minimum                    | Maximum                          | Unit                |

| 11   | Disruptive input injection current <sup>7, 8, 9, 10</sup>                                                                                                                                   | $I_{INJ}$   | −1                         | 1                                | mA                  |
| 12   | Incremental error due to injection current. All channels are 10 k $\Omega$ < $R_s$ < 100 k $\Omega$<br>Channel under test has $R_s = 10$ k $\Omega$ ,<br>$I_{INJ} = I_{INJMAX}, I_{INJMIN}$ | $E_{INJ}$   | −4                         | 4                                | Counts              |
| 13   | Total unadjusted error (TUE) for single ended conversions with calibration <sup>11, 12, 13, 14, 15</sup>                                                                                    | TUE         | −4                         | 4                                | Counts              |

<sup>1</sup> Conversion characteristics vary with  $F_{ADCLK}$  rate. Reduced conversion accuracy occurs at maximum  $F_{ADCLK}$  rate. The maximum value is based on 800 KS/s and the minimum value is based on 20 MHz oscillator clock frequency divided by a maximum 16 factor.

<sup>2</sup> Stop mode recovery time begins when the ADC control register enable bits are set until the ADC is ready to perform conversions.

<sup>3</sup> At  $V_{RH} - V_{RL} = 5.12$  V, one least significant bit (LSB) = 1.25, mV = one count.

<sup>4</sup> Guaranteed 10-bit mono tonicity.

<sup>5</sup> The absolute value of the offset error without calibration  $\leq 100$  counts.

<sup>6</sup> The absolute value of the full scale gain error without calibration  $\leq 120$  counts.

<sup>7</sup> Below disruptive current conditions, the channel being stressed has conversion values of: 0x3FF for analog inputs greater than  $V_{RH}$ , and 0x000 for values less than  $V_{RL}$ . This assumes that  $V_{RH} \leq V_{DDA}$  and  $V_{RL} \geq V_{SSA}$  due to the presence of the sample amplifier. Other channels are not affected by non-disruptive conditions.

<sup>8</sup> Exceeding the limit can cause a conversion error on both stressed and unstressed channels. Transitions within the limit do not affect device reliability or cause permanent damage.

<sup>9</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values using  $V_{POSCLAMP} = V_{DDA} + 0.5$  V and  $V_{NEGCLAMP} = -0.3$  V, then use the larger of the calculated values.

<sup>10</sup> This condition applies to two adjacent pads on the internal pad.

<sup>11</sup> The TUE specification is always less than the sum of the INL, DNL, offset, and gain errors due to canceling errors.

<sup>12</sup> TUE does not apply to differential conversions.

<sup>13</sup> Measured at 6 MHz ADC clock. TUE with a 12 MHz ADC clock is: −16 counts < TUE < 16 counts.

<sup>14</sup> TUE includes all internal device errors such as internal reference variation (75% Ref, 25% Ref).

<sup>15</sup> Depending on the input impedance, the analog input leakage current (Table 9. DC Electrical Specifications, spec 35a) can affect the actual TUE measured on analog channels AN[12], AN[13], AN[14], AN[15].

### 3.11 H7Fa Flash Memory Electrical Characteristics

| 10   | 64 KB block pre-program and erase time                                    | $T_{64kpperase}$  | —    | 415                  | 500                       | 5000              | ms      |
| 8    | 128 KB block pre-program and erase time                                   | $T_{128kpperase}$ | —    | 500                  | 1250                      | 7500              | ms      |
| 11   | Minimum operating frequency for program and erase operations <sup>6</sup> | —                 | 25   | —                    | —                         | —                 | MHz     |

<sup>1</sup> Typical program and erase times are calculated at 25 °C operating temperature using nominal supply values.

<sup>2</sup> Initial factory condition:  $\leq 100$  program/erase cycles, 25 °C, using a typical supply voltage measured at a minimum system frequency of 80 MHz.

<sup>3</sup> The maximum erase time occurs after the specified number of program/erase cycles. This maximum value is characterized but not guaranteed.

<sup>4</sup> Actual hardware programming times. This does not include software overhead.

<sup>5</sup> Page size is 256 bits (8 words).

<sup>6</sup> The read frequency of the flash can range up to the maximum operating frequency. There is no minimum read frequency condition.

Table 15. Flash EEPROM Module Life ( $T_A = T_L$  to  $T_H$ )

| Spec | Characteristic                                                                                                             | Symbol    | Min.    | Typical <sup>1</sup> | Unit   |
|------|----------------------------------------------------------------------------------------------------------------------------|-----------|---------|----------------------|--------|
| 1a   | Number of program/erase cycles per block for 16 KB, 48 KB, and 64 KB blocks over the operating temperature range ( $T_J$ ) | P/E       | 100,000 | —                    | cycles |
| 1b   | Number of program/erase cycles per block for 128 KB blocks over the operating temperature range ( $T_J$ )                  | P/E       | 1000    | 100,000              | cycles |
| 2    | Data retention<br>Blocks with 0–1,000 P/E cycles<br>Blocks with 1,001–100,000 P/E cycles                                   | Retention | 20<br>5 | —<br>—               | years  |

<sup>1</sup> Typical endurance is evaluated at 25° C. Product qualification is performed to the minimum specification. For additional information on the Freescale definition of typical endurance, refer to engineering bulletin EB619 Typical Endurance for Nonvolatile Memory.

Table 16 shows the FLASH\_BIU settings versus frequency of operation. Refer to the device reference manual for definitions of these bit fields.

**Table 16. FLASH\_BIU Settings vs. Frequency of Operation <sup>1</sup>**

| Maximum Frequency (MHz)                  | APC   | RWSC  | WWSC | DPFEN <sup>2</sup>   | IPFEN <sup>2</sup>   | PFLIM <sup>3</sup>   | BFEN <sup>4</sup> |

<sup>1</sup> Illegal combinations exist. Use entries from the same row in this table.

<sup>2</sup> For maximum flash performance, set to 0b11.

<sup>3</sup> For maximum flash performance, set to 0b110.

<sup>4</sup> For maximum flash performance, set to 0b1.

<sup>5</sup> 82 MHz parts allow for 80 MHz system clock + 2% frequency modulation (FM).

<sup>6</sup> 102 MHz parts allow for 100 MHz system clock + 2% FM.

<sup>7</sup> 135 MHz parts allow for 132 MHz system clock + 2% FM.

<sup>8</sup> 147 MHz parts allow for 144 MHz system clock + 2% FM.

## 3.12 AC Specifications

### 3.12.1 Pad AC Specifications

**Table 17. Pad AC Specifications ( $V_{DDEH} = 5.0\text{ V}$ ,  $V_{DDE} = 1.8\text{ V}$ ) <sup>1</sup>**

| Spec | Pad                    | SRC / DSC (binary) | Out Delay (ns) <sup>2, 3, 4</sup> | Rise / Fall <sup>4, 5</sup> (ns) | Load Drive (pF) |
|------|------------------------|--------------------|-----------------------------------|----------------------------------|-----------------|
| 1    | Slow high voltage (SH) | 11                 | 26                                | 15                               | 50              |

| 3    | Fast                     | 00                 | 3.1                               | 2.7                              | 10              |
|      |                          | 01                 |                                   | 2.5                              | 20              |
|      |                          | 10                 |                                   | 2.4                              | 30              |
|      |                          | 11                 |                                   | 2.3                              | 50              |
| 4    | Pullup/down (3.6 V max)  | —                  | —                                 | 7500                             | 50              |
| 5    | Pullup/down (5.5 V max)  | —                  | —                                 | 9000                             | 50              |

<sup>1</sup> These are worst-case values that are estimated from simulation (not tested). The values in the table are simulated at:  $V_{DD} = 1.35\text{--}1.65\text{ V}$ ;  $V_{DDE} = 1.62\text{--}1.98\text{ V}$ ;  $V_{DDEH} = 4.5\text{--}5.25\text{ V}$ ;  $V_{DD33}$  and  $V_{DDSYN} = 3.0\text{--}3.6\text{ V}$ ; and  $T_A = T_L$  to  $T_H$ .

<sup>2</sup> This parameter is supplied for reference and is guaranteed by design (not tested).

<sup>3</sup> The output delay is shown in [Figure 4](#). To calculate the output delay with respect to the system clock, add a maximum of one system clock to the output delay.

<sup>4</sup> The output delay and rise and fall are measured to 20% or 80% of the respective signal.

<sup>5</sup> This parameter is guaranteed by characterization rather than 100% tested.

**Table 18. Derated Pad AC Specifications ( $V_{DDEH} = 3.3\text{ V}$ ,  $V_{DDE} = 3.3\text{ V}$ )<sup>1</sup>**

|      |                         | 11               |                                   | 2.1                              | 50              |
| 4    | Pullup/down (3.6 V max) | —                | —                                 | 7500                             | 50              |
| 5    | Pullup/down (5.5 V max) | —                | —                                 | 9500                             | 50              |

<sup>1</sup> These are worst-case values that are estimated from simulation (not tested). The values in the table are simulated at:  $V_{DD} = 1.35\text{--}1.65\text{ V}$ ;  $V_{DDE} = 3.0\text{--}3.6\text{ V}$ ;  $V_{DDEH} = 3.0\text{--}3.6\text{ V}$ ;  $V_{DD33}$  and  $V_{DDSYN} = 3.0\text{--}3.6\text{ V}$ ; and  $T_A = T_L$  to  $T_H$ .

<sup>2</sup> This parameter is supplied for reference and guaranteed by design (not tested).

<sup>3</sup> The output delay, and the rise and fall, are calculated to 20% or 80% of the respective signal.

<sup>4</sup> The output delay is shown in Figure 4. To calculate the output delay with respect to the system clock, add a maximum of one system clock to the output delay.

<sup>5</sup> This parameter is guaranteed by characterization rather than 100% tested.

**Figure 4. Pad Output Delay**

## 3.13 AC Timing

### 3.13.1 Reset and Configuration Pin Timing

**Table 19. Reset and Configuration Pin Timing <sup>1</sup>**

| Spec | Characteristic                  | Symbol    | Min. | Max. | Unit      |
|------|---------------------------------|-----------|------|------|-----------|
| 1    | RESET pulse width               | $t_{RPW}$ | 10   | —    | $t_{CYC}$ |
| 2    | RESET glitch detect pulse width | $t_{GPW}$ | 2    | —    | $t_{CYC}$ |

Table 19. Reset and Configuration Pin Timing <sup>1</sup> (continued)

| Spec | Characteristic                                                                                      | Symbol            | Min. | Max. | Unit             |
|------|-----------------------------------------------------------------------------------------------------|-------------------|------|------|------------------|
| 3    | PLLCFG, BOOTCFG, WKPCFG, $\overline{\text{RSTCFG}}$ setup time to $\overline{\text{RSTOUT}}$ valid  | $t_{\text{RCSU}}$ | 10   | —    | $t_{\text{CYC}}$ |
| 4    | PLLCFG, BOOTCFG, WKPCFG, $\overline{\text{RSTCFG}}$ hold time from $\overline{\text{RSTOUT}}$ valid | $t_{\text{RCH}}$  | 0    | —    | $t_{\text{CYC}}$ |

<sup>1</sup> Reset timing specified at:  $V_{\text{DDEH}} = 3.0\text{--}5.25\text{ V}$  and  $T_{\text{A}} = T_{\text{L}}$  to  $T_{\text{H}}$ .

### 3.13.2 IEEE 1149.1 Interface Timing

Table 20. JTAG Pin AC Electrical Characteristics <sup>1</sup>

| Spec | Characteristic                                               | Symbol                             | Min. | Max. | Unit |
|------|--------------------------------------------------------------|------------------------------------|------|------|------|
| 1    | TCK cycle time                                               | $t_{\text{JCYC}}$                  | 100  | —    | ns   |
| 2    | TCK clock pulse width (measured at $V_{\text{DDE}} \div 2$ ) | $t_{\text{JDC}}$                   | 40   | 60   | ns   |
| 3    | TCK rise and fall times (40% to 70%)                         | $t_{\text{TCKRISE}}$               | —    | 3    | ns   |
| 4    | TMS, TDI data setup time                                     | $t_{\text{TMSS}}, t_{\text{TDis}}$ | 5    | —    | ns   |
| 5    | TMS, TDI data hold time                                      | $t_{\text{TMSH}}, t_{\text{TDIH}}$ | 25   | —    | ns   |
| 6    | TCK low to TDO data valid                                    | $t_{\text{TDOV}}$                  | —    | 20   | ns   |
| 7    | TCK low to TDO data invalid                                  | $t_{\text{TDOI}}$                  | 0    | —    | ns   |
| 8    | TCK low to TDO high impedance                                | $t_{\text{TDOHZ}}$                 | —    | 20   | ns   |
| 9    | JCOMP assertion time                                         | $t_{\text{JCOMPW}}$                | 100  | —    | ns   |
| 10   | JCOMP setup time to TCK low                                  | $t_{\text{JCMPs}}$                 | 40   | —    | ns   |
| 11   | TCK falling-edge to output valid                             | $t_{\text{BSDV}}$                  | —    | 50   | ns   |

**Table 20. JTAG Pin AC Electrical Characteristics <sup>1</sup> (continued)**

| Spec | Characteristic                                         | Symbol             | Min. | Max. | Unit |
|------|--------------------------------------------------------|--------------------|------|------|------|
| 12   | TCK falling-edge to output valid out of high impedance | $t_{\text{BSDVZ}}$ | —    | 50   | ns   |
| 13   | TCK falling-edge to output high impedance (Hi-Z)       | $t_{\text{BSDHZ}}$ | —    | 50   | ns   |
| 14   | Boundary scan input valid to TCK rising-edge           | $t_{\text{BSDST}}$ | 50   | —    | ns   |
| 15   | TCK rising-edge to boundary scan input invalid         | $t_{\text{BSDHT}}$ | 50   | —    | ns   |

<sup>1</sup> These specifications apply to JTAG boundary scan only. JTAG timing specified at:  $V_{\text{DDE}} = 3.0\text{--}3.6\text{ V}$  and  $T_{\text{A}} = T_{\text{L}}$  to  $T_{\text{H}}$ . Refer to [Table 21](#) for Nexus specifications.

### 3.13.3 Nexus Timing

Table 21. Nexus Debug Port Timing <sup>1</sup>

| Spec | Characteristic                                        | Symbol                 | Min.           | Max. | Unit       |
|------|-------------------------------------------------------|------------------------|----------------|------|------------|
| 1    | MCKO cycle time                                       | $t_{MCYC}$             | 1 <sup>2</sup> | 8    | $t_{CYC}$  |
| 2    | MCKO duty cycle                                       | $t_{MDC}$              | 40             | 60   | %          |
| 3    | MCKO low to MDO data valid <sup>3</sup>               | $t_{MDOV}$             | -1.5           | 3.0  | ns         |
| 4    | MCKO low to $\overline{MSEO}$ data valid <sup>3</sup> | $t_{MSEOV}$            | -1.5           | 3.0  | ns         |
| 5    | MCKO low to $\overline{EVTO}$ data valid <sup>3</sup> | $t_{EVTOV}$            | -1.5           | 3.0  | ns         |
| 6    | $\overline{EVTI}$ pulse width                         | $t_{EVTIPW}$           | 4.0            | —    | $t_{TCYC}$ |
| 7    | $\overline{EVTO}$ pulse width                         | $t_{EVTOPW}$           | 1              | —    | $t_{MCYC}$ |
| 8    | TCK cycle time                                        | $t_{TCYC}$             | 4 <sup>4</sup> | —    | $t_{CYC}$  |
| 9    | TCK duty cycle                                        | $t_{TDC}$              | 40             | 60   | %          |
| 10   | TDI, TMS data setup time                              | $t_{NTDIS}, t_{NTMSS}$ | 8              | —    | ns         |
| 11   | TDI, TMS data hold time                               | $t_{NTDIH}, t_{NTMSH}$ | 5              | —    | ns         |
| 12   | TCK low to TDO data valid                             | $t_{JOV}$              |                |      |            |
|      | $V_{DDE} = 2.25\text{--}3.0\text{ V}$                 |                        | 0              | 12   | ns         |
|      | $V_{DDE} = 3.0\text{--}3.6\text{ V}$                  |                        | 0              | 10   | ns         |
| 13   | $\overline{RDY}$ valid to MCKO <sup>5</sup>           | —                      | —              | —    | —          |

<sup>1</sup> JTAG specifications apply when used for debug functionality. All Nexus timing relative to MCKO is measured from 50% of MCKO and 50% of the respective signal. Nexus timing specified at  $V_{DD} = 1.35\text{--}1.65\text{ V}$ ,  $V_{DDE} = 2.25\text{--}3.6\text{ V}$ ,  $V_{DD33}$  and  $V_{DDSYN} = 3.0\text{--}3.6\text{ V}$ ,  $T_A = T_L$  to  $T_H$ , and  $CL = 30\text{ pF}$  with  $DSC = 0b10$ .

<sup>2</sup> The Nexus AUX port runs up to 82 MHz. Set  $NPC\_PCR[MCKO\_DIV]$  to divide-by-two if the system frequency is greater than 82 MHz.

<sup>3</sup> MDO,  $\overline{MSEO}$ , and  $\overline{EVTO}$  data is held valid until the next MCKO low cycle occurs.

<sup>4</sup> Limit the maximum frequency to approximately 16 MHz ( $V_{DDE} = 2.25\text{--}3.0\text{ V}$ ) or 20 MHz ( $V_{DDE} = 3.0\text{--}3.6\text{ V}$ ) to meet the timing specification for  $t_{JOV}$  of  $[0.2 \times t_{JCYC}]$  as outlined in the IEEE-ISTO 5001-2003 specification.

<sup>5</sup> The  $\overline{RDY}$  pin timing is asynchronous to MCKO and is guaranteed by design to function correctly.

Figure 10. Nexus Output Timing

Figure 11. Nexus TDI, TMS, TDO Timing

### 3.13.4 External Bus Interface (EBI) Timing

Table 22 lists the timing information for the external bus interface (EBI).

Table 22. Bus Operation Timing <sup>1</sup>

| Spec | Characteristic and Description                                                                                                                                                                                                                                 | Symbol            | External Bus Frequency <sup>2, 3</sup> |                |                         |                |                         |                |                         |                | Unit           | Notes                                                                         |

| Calibration bus interface<br>CAL_ADDR[9:30]<br>CAL_DATA[0:15]<br>CAL_RD_WR<br>CAL_TS |                                                                                                                                         |                   |                                        |     |        |     |        |     |        |     |      |       |

<sup>1</sup> EBI timing specified at  $V_{DDE} = 1.6\text{--}3.6\text{ V}$  (unless stated otherwise),  $T_A = T_L$  to  $T_H$ , and  $CL = 30\text{ pF}$  with  $DSC = 0b10$ .

<sup>2</sup> Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including frequency modulation (FM):  
82 MHz parts allow for 80 MHz system clock + 2% FM; 114 MHz parts allow for 112 MHz system clock + 2% FM;  
135 MHz parts allow for 132 MHz system clock + 2% FM; and 147 MHz parts allow for 144 MHz system clock + 2% FM.

<sup>3</sup> The external bus is limited to half the speed of the internal bus.

<sup>4</sup> Refer to fast pad timing in Table 17 and Table 18 (different values for 1.8 V and 3.3 V).

<sup>5</sup> Internal arbitration.

<sup>6</sup> EBTS = 0 timings are tested and valid at  $V_{DDE} = 2.25\text{--}3.6\text{ V}$  only; EBTS = 1 timings are tested and valid at  $V_{DDE} = 1.6\text{--}3.6\text{ V}$ .

<sup>7</sup> External arbitration.

Figure 14. Synchronous Input Timing

### 3.13.5 External Interrupt Timing (IRQ Signals)

Table 23. External Interrupt Timing <sup>1</sup>

| Spec | Characteristic                     | Symbol     | Min. | Max. | Unit      |
|------|------------------------------------|------------|------|------|-----------|
| 1    | IRQ pulse-width low                | $t_{IPWL}$ | 3    | —    | $t_{CYC}$ |
| 2    | IRQ pulse-width high               | $T_{IPWH}$ | 3    | —    | $t_{CYC}$ |
| 3    | IRQ edge-to-edge time <sup>2</sup> | $t_{ICYC}$ | 6    | —    | $t_{CYC}$ |

<sup>1</sup> IRQ timing specified at:  $V_{DDEH} = 3.0\text{--}5.25\text{ V}$  and  $T_A = T_L$  to  $T_H$ .

<sup>2</sup> Applies when IRQ signals are configured for rising-edge or falling-edge events, but not both.

Figure 15. External Interrupt Timing

### 3.13.6 eTPU Timing

Table 24. eTPU Timing <sup>1</sup>

| Spec | Characteristic                  | Symbol     | Min.           | Max | Unit      |
|------|---------------------------------|------------|----------------|-----|-----------|
| 1    | eTPU input channel pulse width  | $t_{ICPW}$ | 4              | —   | $t_{CYC}$ |
| 2    | eTPU output channel pulse width | $t_{OCPW}$ | 2 <sup>2</sup> | —   | $t_{CYC}$ |

<sup>1</sup> eTPU timing specified at:  $V_{DDEH} = 3.0\text{--}5.25\text{ V}$  and  $T_A = T_L$  to  $T_H$ .

<sup>2</sup> This specification does not include the rise and fall times. When calculating the minimum eTPU pulse width, include the rise and fall times defined in the slew rate control fields (SRC) of the pad configuration registers (PCR).

Figure 16. eTPU Timing

### 3.13.7 eMIOS Timing

Table 25. eMIOS Timing <sup>1</sup>

| Spec | Characteristic           | Symbol     | Min.           | Max. | Unit      |
|------|--------------------------|------------|----------------|------|-----------|
| 1    | eMIOS input pulse width  | $t_{MIPW}$ | 4              | —    | $t_{CYC}$ |
| 2    | eMIOS output pulse width | $t_{MOPW}$ | 1 <sup>2</sup> | —    | $t_{CYC}$ |

<sup>1</sup> eMIOS timing specified at:  $V_{DDEH} = 3.0\text{--}5.25\text{ V}$  and  $T_A = T_L$  to  $T_H$ .

<sup>2</sup> This specification does not include the rise and fall times. When calculating the minimum eMIOS pulse width, include the rise and fall times defined in the slew rate control field (SRC) in the pad configuration register (PCR).

Figure 17. eMIOS Timing

### 3.13.8 DSPI Timing

Table 26. MPC5566 DSPI Timing <sup>1, 2</sup>

| Spec | Characteristic                                                 | Symbol     | 80 MHz                           |                                  | 112 MHz                          |                                  | 132 MHz                          |                                  | 144 MHz                          |                                  | Unit |
|------|----------------------------------------------------------------|------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|------|

<sup>1</sup> All DSPI timing specifications use the fastest slew rate (SRC = 0b11) on pad type M or MH. DSPI signals using pad types of S or SH have an additional delay based on the slew rate. DSPI timing is specified at  $V_{DDEH} = 3.0\text{--}5.25\text{ V}$ ,  $T_A = T_L$  to  $T_H$ , and  $CL = 50\text{ pF}$  with SRC = 0b11.

<sup>2</sup> Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including frequency modulation (FM).

82 MHz parts allow for 80 MHz system clock + 2% FM; 114 MHz parts allow for 112 MHz system clock + 2% FM; and 135 MHz parts allow for 132 MHz system clock + 2% FM; and 147 MHz parts allow for 144 MHz system clock + 2% FM.

<sup>3</sup> The minimum SCK cycle time restricts the baud rate selection for the given system clock rate.

These numbers are calculated based on two MPC55xx devices communicating over a DSPI link.

<sup>4</sup> The actual minimum SCK cycle time is limited by pad performance.

<sup>5</sup> The maximum value is programmable in DSPI\_CTARx[PSSCK] and DSPI\_CTARx[CSSCK].

<sup>6</sup> The maximum value is programmable in DSPI\_CTARx[PASC] and DSPI\_CTARx[ASC].

<sup>7</sup> This number is calculated using the SMPL\_PT field in DSPI\_MCR set to 0b10.

### 3.13.9 eQADC SSI Timing

Table 27. EQADC SSI Timing Characteristics

| Spec | Rating                                                    | Symbol        | Minimum              | Typical | Maximum                         | Unit           |
|------|-----------------------------------------------------------|---------------|----------------------|---------|---------------------------------|----------------|
| 2    | FCK period ( $t_{FCK} = 1 \div f_{FCK}$ ) <sup>1, 2</sup> | $t_{FCK}$     | 2                    | —       | 17                              | $t_{SYS\_CLK}$ |
| 3    | Clock (FCK) high time                                     | $t_{FCKHT}$   | $t_{SYS\_CLK} - 6.5$ | —       | $9 \times (t_{SYS\_CLK} + 6.5)$ | ns             |
| 4    | Clock (FCK) low time                                      | $t_{FCKLT}$   | $t_{SYS\_CLK} - 6.5$ | —       | $8 \times (t_{SYS\_CLK} + 6.5)$ | ns             |
| 5    | SDS lead / lag time                                       | $t_{SDS\_LL}$ | -7.5                 | —       | +7.5                            | ns             |
| 6    | SDO lead / lag time                                       | $t_{SDO\_LL}$ | -7.5                 | —       | +7.5                            | ns             |
| 7    | EQADC data setup time (inputs)                            | $t_{EQ\_SU}$  | 22                   | —       | —                               | ns             |
| 8    | EQADC data hold time (inputs)                             | $t_{EQ\_HO}$  | 1                    | —       | —                               | ns             |

<sup>1</sup> SS timing specified at  $V_{DDEH} = 3.0\text{--}5.25\text{ V}$ ,  $T_A = T_L$  to  $T_H$ , and  $CL = 25\text{ pF}$  with  $SRC = 0b11$ . Maximum operating frequency varies depending on track delays, master pad delays, and slave pad delays.

<sup>2</sup> FCK duty cycle is not 50% when it is generated through the division of the system clock by an odd number.

Figure 27. EQADC SSI Timing

### 3.14 Fast Ethernet AC Timing Specifications

Media Independent Interface (MII) Fast Ethernet Controller (FEC) signals use transistor-to-transistor logic (TTL) signal levels compatible with devices operating at 3.3 V. The timing specifications for the MII FEC signals are independent of the system clock frequency (part speed designation).

#### 3.14.1 MII FEC Receive Signal Timing FEC\_RXD[3:0], FEC\_RX\_DV, FEC\_RX\_ER, and FEC\_RX\_CLK

The receive functions correctly up to an FEC\_RX\_CLK maximum frequency of 25 MHz plus one percent. There is no minimum frequency requirement. The processor clock frequency must exceed four times the FEC\_RX\_CLK frequency.

Table 28 lists MII FEC receive channel timings.

Table 28. MII FEC Receive Signal Timing

| Spec | Characteristic                                         | Min. | Max | Unit              |
|------|--------------------------------------------------------|------|-----|-------------------|
| 1    | FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER to FEC_RX_CLK setup | 5    | —   | ns                |
| 2    | FEC_RX_CLK to FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER hold  | 5    | —   | ns                |
| 3    | FEC_RX_CLK pulse-width high                            | 35%  | 65% | FEC_RX_CLK period |
| 4    | FEC_RX_CLK pulse-width low                             | 35%  | 65% | FEC_RX_CLK period |

Figure 28 shows MII FEC receive signal timings listed in Table 28.

Figure 28. MII FEC Receive Signal Timing Diagram

### 3.14.2 MII FEC Transmit Signal Timing

#### FEC\_TXD[3:0], FEC\_TX\_EN, FEC\_TX\_ER, FEC\_TX\_CLK

The transmitter functions correctly up to the FEC\_TX\_CLK maximum frequency of 25 MHz plus one percent. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed twice the FEC\_TX\_CLK frequency.

The transmit outputs (FEC\_TXD[3:0], FEC\_TX\_EN, FEC\_TX\_ER) can be programmed to transition from either the rising- or falling-edge of TX\_CLK, and the timing is the same in either case. These options allow the use of non-compliant MII PHYs.

Refer to the Fast Ethernet Controller (FEC) chapter of the device reference manual for details of this option and how to enable it.

Table 29 lists MII FEC transmit channel timings.

**Table 29. MII FEC Transmit Signal Timing**

| Spec | Characteristic                                           | Min. | Max | Unit              |
|------|----------------------------------------------------------|------|-----|-------------------|
| 5    | FEC_TX_CLK to FEC_TXD[3:0], FEC_TX_EN, FEC_TX_ER invalid | 5    | —   | ns                |
| 6    | FEC_TX_CLK to FEC_TXD[3:0], FEC_TX_EN, FEC_TX_ER valid   | —    | 25  | ns                |
| 7    | FEC_TX_CLK pulse-width high                              | 35%  | 65% | FEC_TX_CLK period |
| 8    | FEC_TX_CLK pulse-width low                               | 35%  | 65% | FEC_TX_CLK period |

Figure 29 shows MII FEC transmit signal timings listed in Table 29.

**Figure 29. MII FEC Transmit Signal Timing Diagram**

### 3.14.3 MII FEC Asynchronous Inputs Signal Timing FEC\_CRIS and FEC\_COL

Table 30 lists MII FEC asynchronous input signal timing.

**Table 30. MII FEC Asynchronous Inputs Signal Timing**

| Spec | Characteristic                        | Min. | Max | Unit              |
|------|---------------------------------------|------|-----|-------------------|
| 9    | FEC_CRIS, FEC_COL minimum pulse width | 1.5  | —   | FEC_TX_CLK period |

Figure 30 shows MII FEC asynchronous input timing listed in Table 30.

**Figure 30. MII FEC Asynchronous Inputs Timing Diagram**

### 3.14.4 MII FEC Serial Management Channel Timing FEC\_MDIO and FEC\_MDC

Table 31 lists MII FEC serial management channel timing. The FEC functions correctly with a maximum FEC\_MDC frequency of 2.5 MHz.

**Table 31. MII FEC Serial Management Channel Timing**

| Spec | Characteristic                                                              | Min. | Max | Unit           |
|------|-----------------------------------------------------------------------------|------|-----|----------------|
| 10   | FEC_MDC falling-edge to FEC_MDIO output invalid (minimum propagation delay) | 0    | —   | ns             |
| 11   | FEC_MDC falling-edge to FEC_MDIO output valid (maximum propagation delay)   | —    | 25  | ns             |
| 12   | FEC_MDIO (input) to FEC_MDC rising-edge setup                               | 10   | —   | ns             |
| 13   | FEC_MDIO (input) to FEC_MDC rising-edge hold                                | 0    | —   | ns             |
| 14   | FEC_MDC pulse-width high                                                    | 40%  | 60% | FEC_MDC period |
| 15   | FEC_MDC pulse-width low                                                     | 40%  | 60% | FEC_MDC period |

Figure 31 shows MII FEC serial management channel timing listed in Table 31.

Figure 31. MII FEC Serial Management Channel Timing Diagram

## 4.1 MPC5566 416 PBGA Pinout

Figure 32, Figure 33, and Figure 34 show the pinout for the MPC5566 416 PBGA package. The alternate Fast Ethernet Controller (FEC) signals are multiplexed with the data calibration bus signals.

### NOTE

The MPC5500 devices are pin compatible for software portability and use the primary function names to label the pins in the BGA diagram. Although some devices do not support all the primary functions shown in the BGA diagram, the muxed and GPIO signals on those pins remain available. See the signals chapter in the device reference manual for the signal muxing.

## 5 Revision History for the MPC5566 Data Sheet

The history of revisions made to this data sheet are listed and described in this section. The information that has changed from a previous revision of this document to the current revision is listed for each revision and are grouped in the following categories:

- Global and text changes
- Table and figure changes

Within each category, the information that has changed is listed in sequential order.

### 5.1 Information Changed Between Revisions 2.0 and 3.0

The following table lists the information that changed in the tables between Rev. 2.0 and 3.0. Click the links to see the change.

**Table 32. Changes Between Rev. 2.0 and 3.0**

| Location                                   | Description of Changes                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 3.7, “Power-Up/Down Sequencing”    | Added the following paragraph in <a href="#">Section 3.7, “Power-Up/Down Sequencing”</a> “During initial power ramp-up, when Vstby is 0.6v or above. a typical current of 1-3mA and maximum of 4mA may be seen until VDD is applied. This current will not reoccur until Vstby is lowered below Vstby min. specification”. |
|                                            | Moved <a href="#">Figure 2 (f1STBY Worst-case Specifications)</a> to <a href="#">Section 3.7, “Power-Up/Down Sequencing”</a> .                                                                                                                                                                                             |
| Section 3.8, “DC Electrical Specifications | In <a href="#">Table 9 (DC Electrical Specifications (T<sub>A</sub> = T<sub>L</sub> to T<sub>H</sub>))</a> for Spec 27d the Characteristic “Refer to Figure 3 for an interpolation of this data” changed to “RAM standby current”.                                                                                         |
|                                            | Changed the footnote attached to IDD_STBY to “The current specification relates to average standby operation after SRAM has been loaded with data. For power up current see <a href="#">Section 3.7, “Power-Up/Down Sequencing”</a> , <a href="#">Figure 2 (f1STBY Worst-case Specifications)</a> ).                       |
|                                            | Removed the footnote “Figure 3 shows an illustration of the IDD_STBY values interpolated for these temperature values”.                                                                                                                                                                                                    |

### 5.2 Information Changed Between Revisions 1.0 and 2.0

The following table lists the information that changed in the tables between Rev. 1.0 and 2.0. Click the links to see the change.

## Table 33. Changes Between Rev. 1.0 and 2.0

| Location                                                 | Description of Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table 3, MPC5566 Thermal Characteristics:                | <p>Changed for production purposes, footnote 1 from:</p> <p>Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other <i>components on the board</i>, and board thermal resistance.</p> <p>to:</p> <p>Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other <i>board components</i>, and board thermal resistance.</p>                                                                                                                                                                                                                                                                                                                                                  |
| Table 6, VCR/POR Electrical Specifications:              | <p>Added footnote 1 to specs 1, 2, and 3 that reads: On power up, assert <math>\overline{\text{RESET}}</math> before <math>V_{\text{POR15}}</math>, <math>V_{\text{POR33}}</math>, and <math>V_{\text{POR5}}</math> negate (internal POR). RESET must remain asserted until the power supplies are within the operating conditions as specified in Table 9 DC Electrical Specifications. On power down, assert <math>\overline{\text{RESET}}</math> before any power supplies fall outside the operating conditions and until the internal POR asserts.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| Table 9, DC Electrical Specifications:                   | <ul style="list-style-type: none"> <li>Added footnote that reads: <math>V_{\text{DDE2}}</math> and <math>V_{\text{DDE3}}</math> are limited to 2.25–3.6 V only if <math>\text{EBTS} = 0</math>; <math>V_{\text{DDE2}}</math> and <math>V_{\text{DDE3}}</math> have a range of 1.6–3.6 V if <math>\text{EBTS} = 1</math>.</li> <li>Removed footnote to specs 27a, b, and c on the max values that read: "Preliminary. Specification pending final characterization."</li> <li>Removed footnote to specs 27a, b, and c on the max values that read: "Specification pending final characterization."</li> </ul>                                                                                                                                                                                                                                                                                                                                |
| Table 16, Flash BIU Settings vs. Frequency of Operation: | <ul style="list-style-type: none"> <li>Removed footnote 9 in columns APC and RWSC for 147 MHz row that read: Preliminary setting. Final setting pending characterization.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Table 22, Bus Operation Timing:                          | <ul style="list-style-type: none"> <li>External Bus Frequency in the table heading: Added footnote that reads: Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including frequency modulation (FM). 82 MHz parts allow for 80 MHz system clock + 2% FM; 114 MHz parts allow for 112 MHz system clock + 2% FM; 135 MHz parts allow for 132 MHz system clock + 2% FM; and 147 MHz parts allow for 144 MHz system clock + 2% FM.</li> <li>Spec 1: Changed the values in Min. columns: 40 MHz from 25 to 24.4; 56 MHz from 17.9 to 17.5</li> <li>Specs 7 and 8: Removed from external bus interface: <math>\overline{\text{BDIP}}</math>, <math>\overline{\text{OE}}</math>, <math>\text{TSIZ}[0:1]</math>, and <math>\overline{\text{WE}}/\overline{\text{BE}}[0:3]</math>.</li> </ul>                                                                                                                          |
| Table 26, DSPI Timing:                                   | <ul style="list-style-type: none"> <li>Table Title: Added footnote that reads: Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including frequency modulation (FM). 82 MHz parts allow for 80 MHz system clock + 2% FM; 114 MHz parts allow for 112 MHz system clock + 2% FM; 135 MHz parts allow for 132 MHz system clock + 2% FM; and 147 MHz parts allow for 144 MHz system clock + 2% FM.</li> <li>Removed footnote that reads: "Specification pending final characterization."</li> <li>Spec 2, <i>PCS to SCK delay</i>, 144 MHz, min. 12</li> <li>Spec 3, <i>After SCK delay</i>, 144 MHz, min. 11</li> <li>Spec 9, <i>Master (MTFE = 1, CPHA = 0)</i>, 144 MHz, min. 7</li> <li>Spec 10, <i>Master (MTFE = 1, CPHA = 0)</i>, 144 MHz, min. 11</li> <li>Spec 11, <i>Master (MTFE = 1, CPHA = 0)</i>, 144 MHz, max. 12</li> <li>Spec 12, <i>Master (MTFE = 1, CPHA = 0)</i>, 144 MHz, min. 1</li> </ul> |

## 5.3 Information Changed Between Revisions 0.0 and 1.0

The following table lists the global changes made throughout the document, as well as the changes to sections of text not contained in a figure or table.

**Table 34. Global and Text Changes Between Rev. 0.0 and 1.0**

| Location                                                                                             | Description of Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Section 3.7.1, "Input Value of Pins During POR Dependent on VDD33:" | <p>Added the following text directly before this section and after <a href="#">Table 8 Pin Status for Medium / Slow Pads During the Power-on Sequence</a>:</p> <p>'The values in <a href="#">Table 7</a> and <a href="#">Table 8</a> do not include the effect of the weak pull devices on the output pins during power up.</p> <p>Before exiting the internal POR state, the voltage on the pins goes to high-impedance until POR negates. When the internal POR negates, the functional state of the signal during reset applies and the weak pull devices (up or down) are enabled as defined in the device <i>Reference Manual</i>. If <math>V_{DD}</math> is too low to correctly propagate the logic signals, the weak-pull devices can pull the signals to <math>V_{DDE}</math> and <math>V_{DDEH}</math>.</p> <p>To avoid this condition, minimize the ramp time of the <math>V_{DD}</math> supply to a time period less than the time required to enable the external circuitry connected to the device outputs.'</p> |
| Section 3.7.3, "Power-Down Sequence (VRC33 Grounded)"               | Deleted the underscore in ORed_POR to become ORed POR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The following table lists the information that changed in the figures or tables between Rev. 0.0 and 1.0.

**Table 35. Table and Figure Changes Between Rev. 0.0 and Rev. 1.0**

| Location                               | Description of Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Figure 1, MPC5500 Family Part Numbers: | <ul style="list-style-type: none"> <li>Removed the 2 in the tape and reel designator in both the graphic and in the Tape and Reel Status text.</li> <li>Changed Qualification Status by adding ' , general market flow' to the M designator, and added an 'S' designator with the description of 'Fully spec. qualified, automotive flow.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Table 1, Orderable Part Numbers:       | <ul style="list-style-type: none"> <li>Added a 144 MHz system frequency option for: <ul style="list-style-type: none"> <li>MPC5566MVR144, Pb-Free (lead free), nominal 144, maximum 147</li> <li>MPC5566MZP144, SnPb (leaded), nominal 144, maximum 147</li> </ul> </li> <li>Changed the 132 MHz maximum operating frequency to 135 MHz.</li> <li>Reordered rows to group devices by lead-free package types in descending frequency order, and leaded package types.</li> <li>Footnote 1 added that reads: All devices are PPC5566, rather than MPC5566 or SPC5566, until product qualifications are complete. Not all configurations are available in the PPC parts.</li> <li>Footnote 2 added that reads: The lowest ambient operating temperature is referenced by <math>T_L</math>; the highest ambient operating temperature is referenced by <math>T_H</math>.</li> <li>Changed footnote 3 from '132 MHz allows only 128 MHz + 2% FM' to '135 MHz parts allow for 132 MHz systems clock + 2% FM'; and added '147 MHz parts allow for 144 MHz systems clock + 2% FM.</li> </ul> |

**Table 35. Table and Figure Changes Between Rev. 0.0 and Rev. 1.0 (continued)**

| Location                             | Description of Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table 2, Absolute Maximum Ratings:   | <ul style="list-style-type: none"> <li>Deleted Spec 3, "Flash core voltage."</li> <li>Spec 12 "DC Input Voltage": Deleted from second line: ". . .except for eTPUB15 and SINB (DSPI_B_SIN)' leaving V<sub>DDEH</sub> powered I/O pads. Deleted third line 'V<sub>DDEH</sub> powered by I/O pads (eTPUB15 and SINB), including the min. and max values of -0.3 and 6.5 respectively, and deleted old footnote 7.</li> <li>Spec 12 "DC Input Voltage": Added footnote 8 to second line "V<sub>DDE</sub> powered I/O pads" that reads: 'Internal structures hold the input voltage less than the maximum voltage on all pads powered by the V<sub>DDE</sub> supplies, if the maximum injection current specification is met (s mA for all pins) and V<sub>DDE</sub> is within the operating voltage specifications.</li> <li>Spec 14, column 2, changed: 'V<sub>SS</sub> differential voltage' to 'V<sub>SS</sub> to V<sub>SSA</sub> differential voltage.'</li> <li>Spec 15, column 2, changed: 'V<sub>DD</sub> differential voltage' to 'V<sub>DD</sub> to V<sub>DDA</sub> differential voltage.'</li> <li>Spec 21, Added the name of the spec, 'V<sub>RC33</sub> to V<sub>DDSYN</sub> differential voltage,' as well as the name and cross reference to Table 9, <i>DC Electrical Specifications</i>, to which the Spec was moved.</li> <li>Spec 28 "Maximum Solder Temperature": Added two subordinate lines:<br/>Lead free (PbFree) and Leaded (SnPb) with maximum values of 260 C and 245 C respectively.</li> <li>Footnote 1, added: 'any of' between 'beyond' and 'the listed maxima.'</li> <li>Deleted footnote 2: 'Absolute maximum voltages are currently maximum burn-in voltages. Absolute maximum specifications for device stress have not yet been determined.' Spec 26 "Maximum Operating Temperature Range": replaced -40 C with T<sub>L</sub>.</li> <li>Footnote 6 (now footnote 5): Changed to the following sentence to the end, "Internal structures hold the input voltage greater than -1.0 V if the injection current limit of 2 mA is met. Keep the negative DC voltage greater than -0.6 V on eTPU[15] and on SINB during the internal power-on reset (POR) state."</li> </ul> |
| Table 4, EMI Testing Specifications: | <ul style="list-style-type: none"> <li>Changed the maximum operating frequency to from 132 to f<sub>MAX</sub>.</li> <li>Footnote 2: Deleted 'Refer to Table 1 for the maximum operating frequency.'</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 35. Table and Figure Changes Between Rev. 0.0 and Rev. 1.0 (continued)

| Location                                                 | Description of Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                      |         |          |   |                                                     |         |          |   |

| Table 12, FMPLL Electrical Characteristics:                                        | <ul style="list-style-type: none"> <li>Added (<math>T_A = T_L - T_H</math>) to the end of the second line in the table title.</li> <li>Spec 1, footnote 1 in column 2: '<i>PLL reference frequency range</i>': Changed to read 'Nominal crystal and external reference values are worst-case not more than 1%. The device operates correctly if the frequency remains within <math>\pm 5\%</math> of the specification limit. This tolerance range allows for a slight frequency drift of the crystals over time. The designer must thoroughly understand the drift margin of the source clock.'</li> <li>Specs 12 and 13: Grouped (2 x CI).</li> <li>Spec 21, column 2: Changed <math>f_{ref\_crystal}</math> to <math>f_{ref}</math> in ICO frequency equation, and added the same equation but substituted <math>f_{ref\_ext}</math> for <math>f_{ref}</math> for the external reference clock, giving:<br/> <math display="block">f_{ico} = [f_{ref\_crystal} \times (MFD + 4)] \div (PREDIV + 1)</math> <math display="block">f_{ico} = [f_{ref\_ext} \times (MFD + 4)] \div (PREDIV + 1)</math> </li> <li>Spec 21, column 4, Max: Deleted old footnote 18 that reads:<br/>The ICO frequency can be higher than the maximum allowable system frequency. For this case, set the CMPLL synthesizer control register reduced frequency divider (FMPLL_SYNCR[RFD]) to divide-by-two (RFD = 0b001). Therefore, for a 40 MHz maximum device (system frequency), program the FMPLL to generate 80 MHz at the ICO output and then divide-by-two the RFD to provide the 40 MHz system clock.'</li> <li>Spec 21: Changed column 5 from '<math>f_{SYS}</math> MHz' to: '<math>f_{MAX}</math>'.</li> <li>Spec 22: Changed column 4, <i>Max Value</i> from <math>f_{MAX}</math> to 20, and added footnote 17 to read, 'Maximum value for dual controller (1:1) mode is (<math>f_{MAX} \div 2</math>) and the predivider set to 1 (FMPLL_SYNCR[PREDIV] = 0b001).'</li> </ul> |
| Table 13, eQADC Conversion Specifications:                                         | <p>Added (<math>T_A = T_L - T_H</math>) to the table title.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
