2.5 V / 3.3 V 7 GHz / 10 Gbps Differential 1:4 LVPECL Fanout Buffer

Multi-Level Inputs with Internal Termination

NB7L14

Description

The NB7L14 is a differential 1:4 LVPECL fanout buffer. The NB7L14 produces four identical LVPECL output copies of Clock or Data operating up to 7 GHz or 10.7 Gb/s, respectively. As such, the NB7L14 is ideal for SONET, GigE, Fiber Channel, Backplane and other Clock or Data distribution applications.

The differential inputs incorporate internal 50 Ω termination resistors that are accessed through the VT Pin. This feature allows the NB7L14 to accept various logic standards, such as LVPECL, CML, LVDS, LVCMOS or LVTTL logic levels. The V_{REFAC} reference output can be used to rebias capacitor-coupled differential or single-ended input signals. The 1:4 fanout design was optimized for low output skew applications.

The NB7L14 is a member of the GigaComm™ family of high performance clock products.

Figure 17. Typical NB7L14 Phase Noise Plot at $f_{\text{Carrier}} = 622.08 \text{ MHz}$, $V_{\text{CC}} = 3.3 \text{ V}$, 25°C

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The additive RMS phase jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 24 fs. The additive RMS phase jitter performance of the translator is highly dependent on the phase noise of the input source.

To obtain the most precise additive phase noise measurement, it is vital that the source phase noise be

notably lower than that of the DUT. If the phase noise of the source is greater than the noise floor of the device under test, the source noise will dominate the additive phase jitter calculation and lead to an incorrect negative result for the additive phase noise within the integration range. The Figure above is a good example of the NB7L14 source generator phase noise having a significantly lower floor than the DUT and results in an additive phase jitter of 24 fs.

$$\text{Additive RMS phase jitter} = \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2}$$

$$24 \text{ fs} = \sqrt{43.26 \text{ fs}^2 - 35.98 \text{ fs}^2}$$
