LOW SKEW, 1-TO-4, CRYSTAL-TO-LVCMOS/LVTTL FANOUT BUFFER

ICS83904I-02

GENERAL DESCRIPTION

The ICS83904I-02 is a low skew, high performance 1-to-4 Crystal Oscillator/Crystal-to-LVCMOS Fanout Buffer and a member of the HiPerClockS[™] family of High Performance Clock Solutions from IDT. The ICS83904I-02 has selectable single-ended clock or two crystal-oscillator inputs. There is an output enable to disable the outputs by placing them into a high-impedance state.

Guaranteed output and part-to-part skew characteristics make the ICS83904I-02 ideal for those applications demanding well defined performance and repeatability.

APPLICATION INFORMATION

CRYSTAL INPUT INTERFACE

Figure 1 shows an example of ICS83904I-02 crystal interface with a parallel resonant crystal. The frequency accuracy can be fine tuned by adjusting the C1 and C2 values. For a parallel crystal with loading capacitance $C_L = 18\text{pF}$, we suggest $C1 = 15\text{pF}$ and $C2 = 15\text{pF}$ to start with. These values may be slightly fine tuned further to optimize the frequency accuracy for different board

layouts. Slightly increasing the C1 and C2 values will slightly reduce the frequency. Slightly decreasing the C1 and C2 values will slightly increase the frequency. For the oscillator circuit below, R1 can be used, but is not required. For new designs, it is recommended that R1 not be used.

FIGURE 1. Crystal Input Interface

LVC MOS TO XTAL INTERFACE

The XTAL_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in Figure 2. The XTAL_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver (R_o) plus the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω . This can also be accomplished by removing R1 and making R2 50Ω .

FIGURE 2. GENERAL DIAGRAM FOR LVC MOS DRIVER TO XTAL INPUT INTERFACE

RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

INPUTS:

CRYSTAL INPUTS

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from XTAL_IN to ground.

CLK INPUT

For applications not requiring the use of the clock input, it can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from the CLK input to ground.

SELECT PINS

All select pins have internal pull-ups and pull-downs; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

OUTPUTS:

LVC MOS OUTPUTS

All unused LVC MOS output can be left floating. There should be no trace attached.
