Electronic Components Sourcing Information

---

## Product Reference Information

**Part Number:** X9418WV24IT1

**Manufacturer:** Renesas Electronics Corporation

**Package:** 24-TSSOP (0.173&quot;, 4.40mm Width)

**Availability:** Please confirm with sales

# X9418

Low Noise/Low Power/2-Wire Bus Dual Digitally Controlled Potentiometers  
(XDCP™)

FN8194  
Rev 2.00  
October 12, 2006

## FEATURES

- Two potentiometers in one package
- 2-wire serial interface
- Register oriented format
  - Direct Read/Write/Transfer Wiper Position
  - Store as many as Four Positions per Potentiometer
- Power supplies
  - $V_{CC} = 2.7V$  to  $5.5V$
  - $V+ = 2.7V$  to  $5.5V$
  - $V- = -2.7V$  to  $-5.5V$
- Low power CMOS
  - Standby current  $< 1\mu A$
  - Ideal for Battery Operated Applications
- High reliability
  - Endurance—100,000 Data Changes per Bit per Register
  - Register Data Retention—100 years
- 8-bytes of nonvolatile memory
- $2.5k\Omega$ ,  $10k\Omega$  resistor array
- Resolution: 64 taps each potentiometer
- 24-pin plastic DIP, 24-lead TSSOP and 24-lead SOIC packages
- Pb-Free plus anneal available (RoHS compliant)

## DESCRIPTION

The X9418 integrates two digitally controlled potentiometers (XDCP) on a monolithic CMOS integrated microcircuit.

The digitally controlled potentiometer is implemented using 63 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the 2-wire bus interface. Each potentiometer has associated with it a volatile Wiper Counter Register (WCR) and 4 nonvolatile Data Registers (DR0:DR3) that can be directly written to and read by the user. The contents of the WCR controls the position of the wiper on the resistor array through the switches. Power up recalls the contents of DR0 to the WCR.

The XDCP can be used as a three-terminal potentiometer or as a two-terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

\*Add "T1" suffix for tape and reel.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## PIN DESCRIPTIONS

### Host Interface Pins

#### Serial Clock (SCL)

The SCL input is used to clock data into and out of the X9418.

#### Serial Data (SDA)

SDA is a bidirectional pin used to transfer data into and out of the device. It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. For selecting typical values, refer to the guidelines for calculating typical values on the bus pull-up resistors graph.

#### Device Address (A<sub>0</sub> - A<sub>3</sub>)

The Address inputs are used to set the least significant 4 bits of the 8-bit slave address. A match in the slave address serial data stream must be made with the Address input in order to initiate communication with the X9418. A maximum of 16 devices may occupy the 2-wire serial bus.

### Potentiometer Pins

**V<sub>H</sub>/R<sub>H</sub> (V<sub>H0</sub>/R<sub>H0</sub> - V<sub>H1</sub>/R<sub>H1</sub>), V<sub>L</sub>/R<sub>L</sub> (V<sub>L0</sub>/R<sub>L0</sub> - V<sub>L1</sub>/R<sub>L1</sub>)**

The V<sub>H</sub>/R<sub>H</sub> and V<sub>L</sub>/R<sub>L</sub> inputs are equivalent to the terminal connections on either end of a mechanical potentiometer.

**V<sub>W</sub>/R<sub>W</sub> (V<sub>W0</sub>/R<sub>W0</sub> - V<sub>W1</sub>/R<sub>W1</sub>)**

The wiper outputs are equivalent to the wiper output of a mechanical potentiometer.

#### Hardware Write Protect Input ( $\overline{WP}$ )

The  $\overline{WP}$  pin when low prevents nonvolatile writes to the Data Registers.

#### Analog Supplies V<sub>+</sub>, V<sub>-</sub>

The Analog Supplies V<sub>+</sub>, V<sub>-</sub> are the supply voltages for the XDCP analog section.

## PIN CONFIGURATION

## PRINCIPLES OF OPERATION

The X9418 is a highly integrated microcircuit incorporating two resistor arrays and their associated registers and counters and the serial interface logic providing direct communication between the host and the XDCP potentiometers.

### Serial Interface

The X9418 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X9418 will be considered a slave device in all applications.

### Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW periods ( $t_{LOW}$ ). SDA state changes during SCL HIGH are reserved for indicating start and stop conditions.

### Start Condition

All commands to the X9418 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH ( $t_{HIGH}$ ). The X9418 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met.

### Stop Condition

All communications must be terminated by a stop condition, which is a LOW to HIGH transition of SDA while SCL is HIGH.

### Acknowledge

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting eight bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9418 will respond with an acknowledge after recognition of a start condition and its slave address and once again after successful receipt of the command byte. If the command is followed by a data byte the X9418 will respond with a final acknowledge.

### Array Description

The X9418 is comprised of two resistor arrays. Each array contains 63 discrete resistive segments that are connected in series. The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $V_H/R_H$  and  $V_L/R_L$  inputs).

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper ( $V_W/R_W$ ) output. Within each individual array only one switch may be turned on at a time. These switches are controlled by the Wiper Counter Register (WCR). The six bits of the WCR are decoded to select, and enable, one of sixty-four switches.

The WCR may be written directly, or it can be changed by transferring the contents of one of four associated Data Registers into the WCR. These Data Registers and the WCR can be read and written by the host system.

### Device Addressing

Following a start condition the master must output the address of the slave it is accessing. The most significant four bits of the slave address are the device type identifier (refer to Figure 1 below). For the X9418 this is fixed as 0101[B].

**Figure 1. Slave Address**

The next four bits of the slave address are the device address. The physical device address is defined by the state of the  $A_0 - A_3$  inputs. The X9418 compares the serial data stream with the address input state; a successful compare of all four address bits is required for the X9418 to respond with an acknowledge. The  $A_0 - A_3$  inputs can be actively driven by CMOS input signals or tied to  $V_{CC}$  or  $V_{SS}$ .

### Acknowledge Polling

The disabling of the inputs, during the internal nonvolatile write operation, can be used to take advantage of the typical 5ms EEPROM write cycle time.

Once the stop condition is issued to indicate the end of the nonvolatile write command the X9418 initiates the internal write cycle. ACK polling can be initiated immediately. This involves issuing the start condition followed by the device slave address. If the X9418 is still busy with the write operation no ACK will be returned. If the X9418 has completed the write operation an ACK will be returned, and the master can then proceed with the next operation.

### Flow 1. ACK Polling Sequence

### Instruction Structure

The next byte sent to the X9418 contains the instruction and register pointer information. The four most significant bits are the instruction. The next four bits point to one of the two pots and when applicable they point to one of four associated registers. The format is shown Figure 2.

**Figure 2. Instruction Byte Format**

The four high order bits define the instruction. The next two bits (R1 and R0) select one of the four registers that is to be acted upon when a register oriented instruction is issued. The last bits (P0) select which one of the two potentiometers is to be affected by the instruction. Bit 1 is defined to be 0.

Four of the nine instructions end with the transmission of the instruction byte. The basic sequence is illustrated in Figure 3. These two-byte instructions exchange data between the wiper counter register and one of the data registers. A transfer from a Data Register to a Wiper Counter Register is essentially a write to a static RAM. The response of the wiper to this action will be delayed  $t_{WRL}$ . A transfer from the wiper counter register (current wiper position), to a Data Register is a write to nonvolatile memory and takes a minimum of  $t_{WR}$  to complete. The transfer can occur between one of the two potentiometers and one of its associated registers;

or it may occur globally, wherein the transfer occurs between both of the potentiometers and one of their associated registers.

Four instructions require a three-byte sequence to complete. These instructions transfer data between the host and the X9418; either between the host and one of the Data Registers or directly between the host and the wiper counter register. These instructions are: Read Wiper Counter Register (read the current wiper position of the selected pot), write Wiper Counter Register (change current wiper position of the selected pot), read Data Register (read the contents of the selected nonvolatile register) and write Data Register (write a new value to the selected Data Register). The sequence of operations is shown in Figure 4.

The Increment/Decrement command is different from the other commands. Once the command is issued and the X9418 has responded with an acknowledge, the master can clock the selected wiper up and/or down in one segment steps; thereby, providing a fine tuning capability to the host. For each SCL clock pulse ( $t_{HIGH}$ ) while SDA is HIGH, the selected wiper will move one resistor segment towards the  $V_H/R_H$  terminal. Similarly, for each SCL clock pulse while SDA is LOW, the selected wiper will move one resistor segment towards the  $V_L/R_L$  terminal. A detailed illustration of the sequence and timing for this operation are shown in Figures 5 and 6 respectively.

**Figure 3. Two-Byte Instruction Sequence**

**Table 1. Instruction Set**

| Instruction                                          | Instruction Set |                |                |                |                |                |                |                | Operation                                                                                                                                            |

## DETAILED OPERATION

Both XDCP potentiometers share the serial interface and share a common architecture. Each potentiometer has a Wiper Counter Register and four Data Registers. A detailed discussion of the register organization and array operation follows.

### Wiper Counter Register

The X9418 contains two wiper counter registers, one for each XDCP potentiometer. The Wiper Counter Register can be envisioned as a 6-bit parallel and serial load counter with its outputs decoded to select one of sixty-four switches along its resistor array. The contents of the WCR can be altered in four ways: it may be written directly by the host via the write Wiper Counter Register instruction (serial load); it may be written indirectly by transferring the contents of one of four associated Data Registers via the XFR Data Register instruction (parallel load); it can be modified one step at a time by the Increment/Decrement instruction. Finally, it is loaded with the contents of its Data Register zero (DR0) upon power-up.

The WCR is a volatile register; that is, its contents are lost when the X9418 is powered-down. Although the register is automatically loaded with the value in DR0 upon power-up, it should be noted this may be different from the value present at power-down.

### Data Registers

Each potentiometer has four nonvolatile Data Registers. These can be read or written directly by the host and data can be transferred between any of the four Data Registers and the Wiper Counter Register. It should be noted all operations changing data in one of these registers is a nonvolatile operation and will take a maximum of 10ms.

If the application does not require storage of multiple settings for the potentiometer, these registers can be used as regular memory locations that could possibly store system parameters or user preference data.

### Register Descriptions

#### Data Registers, (6-Bit), Nonvolatile

| D5    | D4 | D3 | D2 | D1 | D0    |
|-------|----|----|----|----|-------|
| NV    | NV | NV | NV | NV | NV    |
| (MSB) |    |    |    |    | (LSB) |

Four 6-bit Data Registers for each XDCP. (eight 6-bit registers in total).

– {D5~D0}: These bits are for general purpose not volatile data storage or for storage of up to four different wiper values. The contents of Data Register 0 are automatically moved to the Wiper Counter Register on power-up.

**Wiper Counter Register, (6-Bit), Volatile**

| WP5   | WP4 | WP3 | WP2   | WP1 | WP0 |
|-------|-----|-----|-------|-----|-----|
| V     | V   | V   | V     | V   | V   |
| (MSB) |     |     | (LSB) |     |     |

One 6-bit wiper counter register for each XDCCP. (Four 6-bit registers in total.)

– {D5~D0}: These bits specify the wiper position of the respective XDCCP. The Wiper Counter Register is loaded on power-up by the value in Data Register 0. The contents of the WCR can be loaded from any of the other Data Register or directly. The contents of the WCR can be saved in a DR.

**Instruction Format**

**Notes:** (1) "MACK"/"SACK": stands for the acknowledge sent by the master/slave.  
 (2) "A3 ~ A0": stands for the device addresses sent by the master.  
 (3) "X": indicates that it is a "0" for testing purpose but physically it is a "don't care" condition.  
 (4) "I": stands for the increment operation, SDA held high during active SCL phase (high).  
 (5) "D": stands for the decrement operation, SDA held low during active SCL phase (high).

Guidelines for Calculating Typical Values of Bus Pull-Up Resistors

**ABSOLUTE MAXIMUM RATINGS**

Temperature under bias ..... -65°C to +135°C  
 Storage temperature ..... -65°C to +150°C  
 Voltage on SDA, SCL or any address  
   input with respect to  $V_{SS}$  ..... -1V to +7V  
 Voltage on V+ (referenced to  $V_{SS}$ ) ..... 10V  
 Voltage on V- (referenced to  $V_{SS}$ ) ..... -10V  
 (V+) - (V-) ..... 12V  
 Any  $V_H/R_H$ ,  $V_L/R_L$ ,  $V_W/R_W$  ..... V- to V+  
 Lead temperature (soldering, 10 seconds) ..... +300°C  
 $I_W$  (10 seconds) .....  $\pm 6$ mA

**COMMENT**

Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only; functional operation of the device (at these or any other conditions above those listed in the operational sections of this specification) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**RECOMMENDED OPERATING CONDITIONS**

| Temp       | Min.  | Max.  |
|------------|-------|-------|
| Commercial | 0°C   | +70°C |
| Industrial | -40°C | +85°C |

| Device    | Supply Voltage ( $V_{CC}$ ) Limits |
|-----------|------------------------------------|
| X9418     | 5V $\pm$ 10%                       |
| X9418-2.7 | 2.7V to 5.5V                       |

**ANALOG CHARACTERISTICS** (Over recommended operating conditions unless otherwise stated.)

| Symbol        | Parameter                                         |           | Limits |           |          |                   | Test Conditions                                        |

| $I_{SB}$  | $V_{CC}$ current (standby)                        |                     |      | 1                   | $\mu\text{A}$ | SCL = SDA = $V_{CC}$ , Addr. = $V_{SS}$                         |
| $I_{LI}$  | Input leakage current                             |                     |      | 10                  | $\mu\text{A}$ | $V_{IN} = V_{SS}$ to $V_{CC}$                                   |
| $I_{LO}$  | Output leakage current                            |                     |      | 10                  | $\mu\text{A}$ | $V_{OUT} = V_{SS}$ to $V_{CC}$                                  |
| $V_{IH}$  | Input HIGH voltage                                | $V_{CC} \times 0.7$ |      | $V_{CC} + 0.5$      | V             |                                                                 |
| $V_{IL}$  | Input LOW voltage                                 | -0.5                |      | $V_{CC} \times 0.1$ | V             |                                                                 |
| $V_{OL}$  | Output LOW voltage                                |                     |      | 0.4                 | V             | $I_{OL} = 3\text{mA}$                                           |

**Notes:** (1) Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.  
(2) Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.  
(3)  $MI = RTOT/63$  or  $(R_H - R_L)/63$ , single pot

**ENDURANCE AND DATA RETENTION**

| Parameter         | Min.    | Unit                              |
|-------------------|---------|-----------------------------------|
| Minimum endurance | 100,000 | Data changes per bit per register |
| Data retention    | 100     | Years                             |

**CAPACITANCE**

| Symbol          | Test                                        | Max. | Unit | Test Conditions       |
|-----------------|---------------------------------------------|------|------|-----------------------|
| $C_{I/O}^{(4)}$ | Input/output capacitance (SDA)              | 8    | pF   | $V_{I/O} = 0\text{V}$ |
| $C_{IN}^{(4)}$  | Input capacitance (A0, A1, A2, A3, and SCL) | 6    | pF   | $V_{IN} = 0\text{V}$  |

**POWER-UP TIMING**

| Symbol           | Parameter                                 | Min. | Typ. | Max. | Unit   |
|------------------|-------------------------------------------|------|------|------|--------|
| $t_{PUR}^{(5)}$  | Power-up to initiation of read operation  |      |      | 1    | ms     |
| $t_{PUW}^{(5)}$  | Power-up to initiation of write operation |      |      | 5    | ms     |
| $t_{RVCC}^{(6)}$ | $V_{CC}$ Power up ramp rate               | 0.2  |      | 50   | V/msec |

**Power Up Requirements** (Power up sequencing can affect correct recall of the wiper registers)

The preferred power-on sequence is as follows: First  $V_{CC}$ , then  $V_+$  and  $V_-$ , and then the potentiometer pins,  $R_H$ ,  $R_L$ , and  $R_W$ . Voltage should not be applied to the potentiometer pins before  $V_+$  or  $V_-$  is applied. The  $V_{CC}$  ramp rate specification should be met, and any glitches or slope changes in the  $V_{CC}$  line should be held to  $<100\text{mV}$  if possible. If  $V_{CC}$  powers down, it should be held below 0.1V for more than 1 second before powering up again in order for proper wiper register recall. Also,  $V_{CC}$  should not reverse polarity by more than 0.5V. Recall of wiper position will not be complete until  $V_{CC}$ ,  $V_+$  and  $V_-$  reach their final value.

**Notes:** (4) This parameter is periodically sampled and not 100% tested  
(5)  $t_{PUR}$  and  $t_{PUW}$  are the delays required from the time the third (last) power supply ( $V_{CC}$ ,  $V_+$  or  $V_-$ ) is stable until the specific instruction can be issued. These parameters are periodically sampled and not 100% tested.  
(6) This is a tested or guaranteed parameter and should only be used as a guidance.

**A.C. TEST CONDITIONS**

|                               |                                            |
|-------------------------------|--------------------------------------------|
| Input pulse levels            | $V_{CC} \times 0.1$ to $V_{CC} \times 0.9$ |
| Input rise and fall times     | 10ns                                       |
| Input and output timing level | $V_{CC} \times 0.5$                        |

| $t_{DH}$     | SDA data output hold time                             | 50   |      | ns   |
| $T_I$        | Noise suppression time constant at SCL and SDA inputs | 50   |      | ns   |
| $t_{BUF}$    | Bus free time (prior to any transmission)             | 1300 |      | ns   |
| $t_{SU:WPA}$ | $\overline{WP}$ , A0, A1, A2 and A3 setup time        | 0    |      | ns   |
| $t_{HD:WPA}$ | $\overline{WP}$ , A0, A1, A2 and A3 hold time         | 0    |      | ns   |

## HIGH-VOLTAGE WRITE CYCLE TIMING

| Symbol   | Parameter                                          | Typ. | Max. | Unit |
|----------|----------------------------------------------------|------|------|------|
| $t_{WR}$ | High-voltage write cycle time (store instructions) | 5    | 10   | ms   |

## XDCP TIMING

| Symbol     | Parameter                                                                         | Min. | Max. | Unit    |
|------------|-----------------------------------------------------------------------------------|------|------|---------|
| $t_{WRPO}$ | Wiper response time after the third (last) power supply is stable                 |      | 10   | $\mu$ s |
| $t_{WRL}$  | Wiper response time after instruction issued (all load instructions)              |      | 10   | $\mu$ s |
| $t_{WRID}$ | Wiper response time from an active SCL/SCK edge (increment/decrement instruction) |      | 10   | $\mu$ s |

**Note:** (8) A device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

## TIMING DIAGRAMS

### START and STOP Timing

### Input Timing

### Output Timing

## XDCP Timing (for All Load Instructions)

## XDCP Timing (for Increment/Decrement Instruction)

## Write Protect and Device Address Pins Timing

## APPLICATIONS INFORMATION

### Basic Configurations of Electronic Potentiometers

Three terminal Potentiometer;  
Variable voltage divider

Two terminal Variable Resistor;  
Variable current

### Application Circuits

#### NONINVERTING AMPLIFIER

$$V_O = (1 + R_2/R_1)V_S$$

#### VOLTAGE REGULATOR

$$V_O (\text{REG}) = 1.25V (1 + R_2/R_1) + I_{\text{adj}} R_2$$

#### OFFSET VOLTAGE ADJUSTMENT

#### COMPARATOR WITH HYSTERESIS

$$V_{UL} = \{R_1/(R_1 + R_2)\} V_O(\text{max})$$

$$V_{LL} = \{R_1/(R_1 + R_2)\} V_O(\text{min})$$

## Application Circuits (continued)

ATTENUATOR

$$V_O = G V_S$$

$$-1/2 \leq G \leq +1/2$$

FILTER

$$G_O = 1 + R_2/R_1$$

$$f_c = 1/(2\pi RC)$$

INVERTING AMPLIFIER

$$V_O = G V_S$$

$$G = -R_2/R_1$$

EQUIVALENT L-R CIRCUIT

$$Z_{IN} = R_2 + s R_2 (R_1 + R_3) C_1 = R_2 + s L_{eq}$$

$$(R_1 + R_3) \gg R_2$$

FUNCTION GENERATOR

$$\text{frequency} \propto R_1, R_2, C$$

$$\text{amplitude} \propto R_A, R_B$$

## Dual-In-Line Plastic Packages (PDIP)

### NOTES:

1. Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
4. Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
5. D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
6. E and  $e_A$  are measured with the leads constrained to be perpendicular to datum  $-C-$ .
7.  $e_B$  and  $e_C$  are measured at the lead tips with the leads unconstrained.  $e_C$  must be zero or greater.
8. B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
9. N is the maximum number of terminal positions.
10. Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).

## Small Outline Plastic Packages (SOIC)

### NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

#### NOTES:

1. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15mm per side.
2. Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm per side.
3. Dimensions "D" and "E1" are measured at dAtum Plane H.
4. Dimensioning and tolerancing per ASME Y14.5M-1994.
